Masaki Kashiwara (Kyoto Univ.)	Categorifications and quiver Hecke algebras	

概要 Fomin–Zelevinsky introduced the notion of cluster algebras and they proved (in a prticular case) that the quantum coordinate ring has a cluster algebra structure. In this talk, we discuss such a cluster algebra structures using its categorification by quiver Hecke algebras introduced by Rouquier and Khovanov–Lauda. This is a joint work with Seok-Jin Kang, Myungho Kim, Se-jin Oh and Euiyong Park.

服部哲弥(慶大経済) Amazon ランキングと確率順位付け模型の流体力学極限 · · · (13:00~14:00) Tetsuya Hattori (Keio Univ.) Amazon ranking and hydrodynamic limit of stochastic ranking process

概要 We review our mathematical and applied studies on large particle numbers (hydrodynamic) limits of stochastic ranking processes (SRP), systems of particles aligned in a line with move-to-front rules driven by point processes. On the application side, we observe that a simple version of the model, driven by the Poisson processes, explains behaviors of book ranking numbers at Amazon.co.jp. The results further imply that the main sales of the company is from top sales books, in opposition to expectations of possibilities of long-tail business model. On the mathematical study, we prove a hydrodynamic limit of SRP with position dependent intensities, allowing dependence of intensity functions of the driving processes on positon variables, which mathematically implies non-trivial stochastic dependence among the particles, complicating the studies. To overcome the difficulties, we introduce an intermediate model, SRP with flow driven intensities, which is driven by what we name 'the point processes with last-arrival-time dependent intensities' (PPLATDI), which, unlike Poission processes, lack independence of disjoint increments. The solutions in the hydrodynamic limit correspond to those of the systems of partial differential equations of one-dimensional fluid solved by characteristic curves, generalized to allow for non-local interaction terms, and whose solutions are found to be written by the expectations of PPLATDI.

平 地 健 吾 (東 大 数 理) ゲ ベルグマン核に関するラマダノフ予想 (13:00~14:00) Kengo Hirachi (Univ. of Tokyo) Ramadanov conjecture for the Bergman kernel

概要 In 1974, Charles Fefferman proved that the Bergman kernel for strictly pseudoconvex domains has pole type and logarithmic type singularities. Since then many people thought that the logarithmic singularity vanishes if and only if the domain is biholomorphic to the ball—it is so called the Ramadanov conjecture. It is affirmatively solved in dimensions 2 more than 30 yeas ago, but is still open in higher dimensions. In this talk, I will explain the current status of the conjecture starting from the basic facts on CR geometry and complex Monge-Ampère equation.

望月拓郎(京大数理研) 調和束、モノポール、インスタントン —微分幾何と代数幾何の 交錯—・・・・・・・・・・・・・・・・・・・・・・・・・・・・・・・・(13:00~14:00) Takuro Mochizuki (Kyoto Univ.) Harmonic bundles, monopoles and instantons —an intersection of differential geometry and algebraic geometry—

概要 One of the interesting themes in complex differential geometry is to pursue a natural correspondence between objects in differential geometry and algebraic geometry. In particular, the variants of "Kobayashi–Hitchin correspondence" have been studied for a long time. The original theorem says that an algebraic vector bundle on a complex projective manifold has a Hermitian–Einstein metric if and only if it is stable. Among many variants, the most interesting is the "trinity" of Higgs bundles, flat bundles and harmonic bundles, which is a starting point of the so called non-abelian Hodge theory. After the study of the singularity, we obtained a correspondence between semisimple algebraic holonomic D-modules and polarizable pure twistor D-modules, which was applied to the study of the functoriality of the semisimplicity of algebraic holonomic D-modules.

The abstract existence theorem and the functorial property of mixed twistor D-modules imply that harmonic bundles exist ubiquitously. It is expected that they are related to concrete examples of "1-parameter family of flat bundles degenerating to a Higgs bundle" which naturally appear in various fields of mathematics, called quantum curves, quantum D-modules, etc. For that purpose, it would be useful to obtain more explicit information for some classes of twistor D-modules. For instance, we made some explicit computations for GKZ-systems and Toda equations.

More recently, by pursing an analogue of the non-abelian Hodge theory, we are interested in Kobayashi–Hitchin correspondences for monopoles with periodicity, and it turned out that they are equivalent to difference modules of various types which have not yet been intensively studied in differential geometry. It is expected that the equivalences would be a starting point of new rich studies.

概要 In this talk, I would like to present, mainly to non-specialists, some of the results concerning homogeneous open convex cones obtained during these 20 years or so by collaborating with Hideyuki Ishi, Chifune Kai, Hideto Nakashima and Takashi Yamasaki. Topics include the minimum size matrix realization with the help of weighted oriented graphs, basic relative invariants, various characterizations of symmetric cones among homogeneous open convex cones, interesting examples of homogeneous open convex cones etc.

#+ D/1-7/-+ = # \- / 1 + # # \- / 4

概要 In this talk, we give a structure theorem for projective manifolds W_0 with the property of admitting a 1-parameter deformation where W_t is a hypersurface in a projective smooth manifold Z_t . Their structure is the one of special iterated univariate coverings which we call of normal type. We give an application to the case where Z_t is a projective space, respectively an abelian variety. We also give a characterization of smooth ample hypersurfaces in abelian varieties and describe an irreducible connected component of their moduli space. This is a joint work with Fabrizio Catanese.

概要 I consider the Allen–Cahn equation (or Nagumo equation) in a set Ω of some special type. For semilinear parabolic equations, there are a lot of studies on the initial value problem in the case that Ω is a bounded or unbounded domain. The existence and uniqueness of solutions and analysis of behavior of solution u for t grows up to infinity are important problems. In this talk I deal with the case that Ω is a star graph which is a union of several half lines connected at the common end point (or a network of some special type) and consider the existence of time entire solutions and their structure. The "time entire" implies that a solution u = u(t, x) exists for all $t \in (-\infty, \infty)$. I explain some results obtained through the joint work with Y. Takazawa (Hokkaido Univ.) and Y. Morita (Ryukoku Univ.).

第VI会場

概要 This is joint work Jens Niklas Eberhardt. Categories of mixed *l*-adic sheaves and mixed Hodge modules are indispensable tools in geometric representation theory. They are used in the proof of the Kazhdan–Lusztig conjecture, uncover hidden gradings in categories of representations or categorify objects such as Hecke algebras, representations of quantum groups and link invariants, to name a few. But they are—by their nature—limited to characteristic zero coefficients.

In this talk, I will discuss a formalism of mixed sheaves with coefficients in characteristic p following ideas of Soergel, Wendt, and Virk to make use of the recent developments in the world of motivic sheaves. As an application, our work produces a geometric and graded version of Soergel's modular category $\mathcal{O}(G)$, consisting of rational representations of a split semisimple group G over a positive characteristic field, thereby equipping it with a full six functor formalism. In particular, one can express characters of irreducible modules of SL_n in terms of mixed motives.

determinant later.

鈴木登志雄(首都大東京理)

Masahiro Kumabe Solovay reduction and continuity

(Open Univ. of Japan)

Kenshi Miyabe (Meiji Univ.)

Yuki Mizusawa (Tokyo Metro. Univ.)

Toshio Suzuki (Tokyo Metro. Univ.)

概要 In the theory of computability, the concept of reduction is a certain type of pseudo order that compares complexity of two sets of natural numbers, or two real numbers. The aim of our talk is a better understanding of the relationships between reduction and continuity. We observe that Solovay reduction is characterized by the existence of a certain Lipschitz continuous real function. Then we ask whether there is a concept of reducibility that exactly corresponds to Hoelder continuous function (with order less than or equal to 1). We show this is the case. We introduce the concept of quasi Solovay reduction. We separate it from Solovay reduction and from Turing reduction. We investigate the relationships between quasi Solovay complete sets and randomness.

11 只木孝太郎 (中 部 大 工) アルゴリズム的ランダムネスによる量子情報理論の精密化 II 15 Kohtaro Tadaki (Chubu Univ.) A refinement of quantum information theory by algorithmic randomness II

概要 The notion of probability plays a crucial role in quantum mechanics. It appears as the Born rule. In modern mathematics which describes quantum mechanics, however, probability theory means nothing other than measure theory, and therefore any operational characterization of the notion of probability is still missing in quantum mechanics. In our former works, based on the toolkit of algorithmic randomness, we presented an alternative rule to the Born rule, called the principle of typicality, for specifying the property of results of measurements in an operational way. In this talk, we reformulate the quantum operations formalism in terms of the principle of typicality, in order to demonstrate how properly our framework works in practical problems in quantum mechanics.

Masanao Ozawa (Nagoya Univ.) Improving Takeuti's quantum set theory to satisfy De Morgan's law for bounded quantifications

概要 In classical set theory, De Morgan's laws (i) $\neg(\forall x \in a)$ $A(x) \Leftrightarrow (\exists x \in a)$ $\neg A(x)$ and (ii) $\neg(\exists x \in a)$ $A(x) \Leftrightarrow (\forall x \in a)$ $\neg A(x)$ hold for bounded quantifications. However, these laws do not hold in Takeuti's quantum set theory. Here, we show that Takeuti's quantum set theory can be improved so that these De Morgan's laws hold, while maintaining the results obtained so far, such as the transfer principle for theorems of ZFC set theory. As a result, duality is established between conjunction and disjunction, universal quantification and existential quantification in quantum set theory just as in classical set theory, and more powerful developments will be expected in quantum set theory and its applications.

16:45~17:45 特別講演

D. A. Mejía (静 岡 大 理) Cichon's maximum over ZFC alone

Diego A. Mejía (Shizuoka Univ.) Cichon's maximum over ZFC alone

概要 A very classical subject of study in combinatorics of the real line is Cichon's diagram, which lists cardinal characteristics (and the provable relations between them) that encompasses combinatorial concepts related to measure and category of the real line, and to compactness of subsets of irrational numbers.

It is known that Cichon's diagram is complete, in the sense that no other inequality between them can be proved. However, just in the present decade it has been explored consistency results regarding three or more different values considered simultaneously in the diagram.

Is it consistent with ZFC that all the cardinals in Cichon's diagram are pairwise different? This is the main question of the research mentioned above.

A couple of years ago, Goldstern, Kellner and Shelah used large cardinals to answer this question affirmatively. Just very recently, the speaker joined their work, and they managed to show how to prove this consistency result without using large cardinals.

Saburou Saitoh Meanings of zero and infinity; Relations of zero and infinity (Gunma Univ.*/Inst. of Reproducing Kernels)

概要 Zero and infinity are, of course, have long histories over mathematics. From the division by zero, we found some basic meanings of zero and infinity, as mathematics. We would like to talk some global viewpoints on zero and infinity. We will give their definitions first clearly as mathematics. We will introduce a surprising relationship of zero and infinity, clearly in this talk based on the cited references.

20 鈴 木 信 行 (静 岡 大 理) Kripke 枠不完全かつ代数的不完全な中間述語論理をたくさん作っていた15

Nobu-Yuki Suzuki (Shizuoka Univ.) Logics constructed in my previous talk are incomplete with respect to Kripke and algebraic frames

概要 In the previous talk (MSJ Spring Meeting 2018), we reported that there exists a continuum of intermediate predicate logics that have the disjunction property but lack the existence property. In this talk, we report that the logics constructed in this way are all incomplete with respect to Kripke-frame semantics and algebraic frame semantics. Note that these logics have the same propositional part as intuitionistic logic.

概要 Standard sequent calculi for modal logics S5 and K4B do not enjoy the cut-elimination property. Takano showed that the application of (cut) in these calculi can be restricted to analytic cut. For some modal logics, he investigated the relationships between the inference rules and semantical properties by introducing analytically saturated sequents. By extending his method, we found that we can improve the restriction of (cut) in S5 and K4B. We can prove finite model property of these logics simultaneously.

22	志村立矢(日大理工)	様相論理 $\mathbf{KD4Z_{14}}$ とその周辺 \dots	15
	Tatsuva Shimura (Nihon Univ.)	Modal logics around KD47.	

概要 The modal propositional logic $KD4Z_{14}$ is an irreflexive counter part of S4.1.4. We treat $KD4Z_{14}$ and a little weaker logic $K4Z_{14}^+$.

- 1. Both logics have cut-free systems.
- 2. Both logics have f.m.p. and Craig interpolation property, and these properties can be proved simultaneously.

概要 In non-associative substructural logics, we can consider not only the weakening rules in the usual sense but also restricted weakening rules associated with associativity. In this talk, we introduce a cut-free Gentzen-style formulation for some non-associative substructural logics with restricted weakening rules, and consider some related topics.

Hidenori Kurokawa (Kanazawa Univ.) The completeness theorem revisited

概要 In this talk, we reconsider the significance of the completeness theorem, primarily, for classical first-order logic. We argue that the significance of the theorem is more complicated than often discussed, since it ultimately rests on the issue of how we should consider the relationship between pertinent informal (or preformal) logical concepts and formal counterparts thereof. More specifically, we first give a concise historical overview of the theorem. Secondly, we discuss a few conceptual problems concerning the theorem. Thirdly, we pay attention to what is often called 'Kreisel's squeezing argument,' which has been given in order to solve one of the conceptual problems that arise in relation to the significance of the completeness theorem. Finally, we discuss both limitations and repercussions of Kreisel's argument, focusing on Kreisel's methodological concept called 'informal rigour,' which has been introduced to handle the foregoing issue.

24 藤 田 憲 悦 (群 馬 大 理 工) Equational theory and reduction rules of reduction paths · · · · · · · · · 15 Ken-etsu Fujita (Gunma Univ.) Equational theory and reduction rules of reduction paths

概要 We introduce a formal system of reduction paths as an extension of a monoid-like structure. Our motivation comes from a quantitative analysis of reduction systems based on the perspective of computational cost and orbit. From the perspective, we define a formal system of reduction paths for parallel reduction, wherein paths are generated from a quiver by means of three path-operators. Next, we introduce an equational theory and reduction rules for paths, and show that the rules on paths are terminating and confluent so that normal paths are obtained. Following normal paths, a graphical representation of reduction paths is provided. Then we show that the reduction graph is a plane graph, and unique path and universal common-reduct properties are established.

概要 We consider how to define adequate semantics for the simple type assignment system for lambda calculus such that $M:\tau$ is provable if and only if $M:\tau$ is valid in the semantics.

	Yuya Okawa (Chiba Univ.)	Around Guaspari's problem on partially conservative sentences
	Taishi Kurahashi	
	(Nat. Inst. of Tech., Kisarazu Coll.)	

概要 A sentence φ is said to be Γ -conservative over T if for every Γ sentence θ , if $T + \varphi \vdash \theta$, then $T \vdash \theta$. For $\Gamma = \Sigma_n$ (resp. Π_n), let $\Gamma^d = \Pi_n$ (resp. Σ_n). In 1979, Guaspari proved that for any reasonable theory T, there is an independent Γ^d sentence φ which is Γ -conservative over T. Also Guaspari asked the following question: For any reasonable theories T_0 and T_1 , is there a Γ^d sentence which is simultaneously independent and Γ -conservative over both T_0 and T_1 ? For $\Gamma = \Sigma_n$, this problem was solved negatively by Bennet, however, for $\Gamma = \Pi_n$, it has not been settled yet.

First, we introduce a new sufficient condition about the existence of simultaneously independent Π_n conservative Σ_n sentences. Secondly, we investigate the situation of the existence of such sentences in the
case of finite sequences of theories.

<u>Sohei Iwata</u> (Kobe Univ.) Fixed-point properties in predicate modal logics Taishi Kurahashi (Nat. Inst. of Tech., Kisarazu Coll.)

概要 It is known that the propositional provability logic **GL** satisfies the fixed-point property. However, Montagna showed that the predicate modal logic **QGL** loses the fixed-point property. In this talk, we prove that several extensions of **QGL** including Tanaka's system **NQGL** do not have the fixed-point property. Secondly, we prove that the fixed-point theorem for $\mathbf{QK} + \Box^{n+1} \bot$. As a consequence, we obtain that the class \mathcal{BL} of Kripke frames which are transitive and of bounded length satisfies the fixed-point property locally. We also obtain that **NQGL** does not satisfy the Craig interpolation property. Finally, we investigate a sufficient condition for formulas to have a fixed-point in **QGL**.

概要 We investigate relationships between Gödel's second incompleteness theorem and derivability conditions for provability predicates. First, we exhibit some new sets of derivability conditions which are sufficient for unprovability of the consistency statement $\forall x(\Pr_T(x) \to \neg \Pr_T(\dot{\neg} x))$. Secondly, we show that Hilbert–Bernays' conditions and Löb's conditions are mutually incomparable. Thirdly, we show that both of Hilbert–Bernays' conditions and Löb's conditions do not accomplish Gödel's original statement of the second incompleteness theorem. At last, we improve Buchholz's proof of uniform version of provable Σ_1 -completeness.

 - 概要 For a transitive permutation group, if its permutation character is decomposed into the sum of irreducible characters with all their multiplicity 1, then the transitive permutation group is called multiplicity-free. An association scheme constructed by a transitive permutation group is commutative if and only if the transitive permutation group is multiplicity-free. As a generalization of the multiplicity-free condition, we introduce the concept of nearly multiplicity-free for imprimitive permutation groups and some relations to association schemes. In particular, we construct bases of matrix units for such association schemes.
- 2 竹ヶ原裕元 (室蘭工大工) 有限アーベル p 群の置換表現の個数に関する p 進的性質について · · · · · 15 Yugen Takegahara p-adic properties of the number of permutation representations of a (Muroran Inst. of Tech.) finite abelian p-group
 - 概要 Let p be a prime. Suppose that P is a finite abelian p-group of type $m=(m_1,m_2,\cdots)$ with $m_1 \geq m_2 \geq \cdots$ and $\sum m_i = s$. Define nonnegative integers u and v by $u = \max\{m_1, [(s+1)/2]\}$ and $v = \min\{s-m_1, [s/2]\}$. For each nonnegative integer n, let $h_n(P)$ denote the number of homomorphisms from P to the symmetric group S_n on n letters. Except for the case where p=2 and $u+\delta_{v0} \leq v+1$ or p=3 and $u=v\geq 1$, there exist p-adic analytic functions $f_r(X)$ for $r=0,1,\cdots,p^{u+1}-1$ and a polynomial $g(X)\in\mathbb{Z}[X]$ such that for any nonnegative integer v, $h_{p^{u+1}y+r}(P)=p^{\{\sum_{j=1}^u p^j-(u-v)\}y}f_r(y)\prod_{j=1}^y g(j)$ and $\operatorname{ord}_p(h_{p^{u+1}y+r}(P))=\{\sum_{j=1}^u p^j-(u-v)\}y+\operatorname{ord}_p(f_r(y))$. If $p=2, \lambda_3=0$, and $u=v\geq 1$ or if p=3 and $u=v\geq 1$, then $h_n(P)$ has analogous properties.
- - 概要 The modular isomorphism problem—which is open for more than 60 years—asks whether $\mathbb{F}_pG \cong \mathbb{F}_pH$ implies $G \cong H$ for finite p-groups G and H. In this talk, we introduce a new class of finite groups and provide a criterion (sufficient condition) for the problem from adjoint and counting homomorphisms. New proofs for the theorems by Deskins and Passi–Sehgal are provided.

Shigeto Kawata (Nagoya City Univ.) On almost split sequences and tensor products for group rings

概要 Let \mathcal{O} be a complete discrete valuation ring of characteristic zero with residue class field of characteristic p > 0. Let $\mathcal{O}G$ be the group ring of a finite group G over \mathcal{O} . Suppose that L is a virtually irreducible $\mathcal{O}G$ -lattice with vertex Q and p'-rank Q-source. Then the tensor product of an almost split sequence terminating in a Scott $\mathcal{O}G$ -lattice with vertex Q and L is the direct sum of an almost split sequence terminating in L and a split sequence.

川 節 和 哉 (京大数理研) 頂点作用素代数とモジュラー微分方程式

Kazuya Kawasetsu (Kyoto Univ.) Vertex operator algebras and modular differential equations

概要 Vertex operator algebras are, shortly speaking, algebras of quantum fields and admit a lot of important infinite-dimensional graded representations. They appear as (chiral) symmetry algebras of 2d conformal field theory and these days also appear as a kind of invariants of 4d $\mathcal{N}=2$ superconformal field theory. It is known that the characters of modules over vertex operator algebras with some finiteness conditions satisfy modular differential equations, which are linear ordinary differential equations invariant under the action of $SL_2(\mathbb{Z})$. This allows us to study characters of modules using theory of differential equations and modular forms. In this talk, we recall modular differential equations and explain their application to study representations of vertex operator algebras. This talk is based on joint works with Tomoyuki Arakawa and Yuichi Sakai.

Takeshi Ikeda (Okayama Univ. of Sci.)

Multiplicities of points on Schubert varieties in the symplectic flag variety

概要 Let Sp_{2n} be a symplectic group and $B \subset Sp_{2n}$ be a Borel subgroup. It is known that Schubert subvarieties of flag variety Sp_{2n}/B have singular points. The combinational formula of multiplicities of points on Schubert varieties in symplectic Grassmannian is already known (Ghorpade and Raghavan 2006, Ikeda and Naruse 2009). We were able to obtain a combinatorial formula of multiplicities of points on Schubert varieties of symplectic flag variety. That is an extension of the case of symplectic Grassmannian. This research is a joint work with David Anderson and Minyoung Jeon.

	Yoshiharu Shibata (Yamaguchi Univ.) Isao Kikumasa (Yamaguchi Univ.) Yosuke Kuratomi (Yamaguchi Univ.)	On d-square free modules over a right perfect ring

概要 A module M is square free if whenever its submodule is isomorphic to $N^2 = N \oplus N$ for some module N, then N = 0. We introduce the dual concept "d-square free"; a module M is d-square free if whenever its factor module is isomorphic to $N^2 = N \oplus N$ for some module N, then N = 0. This property is not closed under submodules and essential extensions in general. The main purpose is to study rings whose d-square free modules are all closed under submodules and essential extensions.

概要 We have studied about group algebras of non-noetherian groups and showed that they are often primitive if base groups have non-abelian free subgroups. Our main method was two edge-colored graph theory. In general our method using these graphs seems to be effective for a group algebra of a group with a non-abelian free subgroup. But there exist some non-Noetherian groups with no non-abelian free subgroups such as a Thompson group F. In this talk, we introduce an improvement of our graph theory and its application to a problem on a group algebra of a Thompson group F.

22	中島規博(名 エ 大) 3次元超平面配置の高階自由性と Holm の問題・・・・・・・10 Norihiro Nakashima (Nagoya Inst. of Tech.) High order freeness for 3-arrangements and Holm's problems
	概要 The m -free arrangement is a generalization of the free arrangement where m is a nonnegative integer. Holm asked whether all arrangements are m -free for m large enough. In a recent work by Abe and the speaker, counter examples are given for the question when the dimension of vector space is grater than three. However the question is still open when m is three. In this talk I show that 3-arrangements are m -free for m large enough and determine m -exponents in that cases.
23	嶋 田 芳 (明 大 理 工) On the radius of the category of totally reflexive modules · · · · · · · · · 10 Kaori Shimada (Meiji Univ.) On the radius of the category of totally reflexive modules
	概要 The radius of subcategories of abelian categories was introduced by Dao and Takahashi in 2014 as an analogue of the dimension of triangulated categories. We focus on the category consisting of totally reflexive R -modules $G(R)$ and we find an upper bound of the radius of $G(R)$ when R is a residue class ring of a Noetherian local ring.
24	神 代 真 也 (千葉大融合理工) 非 Gorenstein 環における Auslander-Reiten 予想 · · · · · · 15 Shinya Kumashiro (Chiba Univ.) The Auslander-Reiten conjecture for non-Gorenstein rings
	概要 Let R be a Cohen-Macaulay local ring and Q be an ideal of R generated by a regular sequence on R . Due to M. Auslander, S. Ding, and Ø. Solberg, the Auslander-Reiten conjecture holds for R if and only if it holds for R/Q . In the former part of this talk, we study the Auslander-Reiten conjecture for the ring R/Q^{ℓ} in connection with that for R . As a corollary, the Auslander-Reiten conjecture holds for determinantal rings with some conditions. In the latter part, we study the existence of Ulrich ideals and generalize the result of J. Sally. We finally show that the Auslander-Reiten conjecture holds if there is an Ulrich ideal whose residue ring is a complete intersection.
25	磯部遼太郎 (千 葉 大 理) Ulrich ideals in hypersurfaces · · · · · · · · · · · · · · · · · · ·
	概要 The purpose of this talk is to investigate the structure and ubiquity of Ulrich ideals in a hypersurface ring. In a Cohen–Macaulay local ring (R, m) , an m-primary ideal I is called an Ulrich ideal in R if there exists a parameter ideal Q of R such that $I \supseteq Q$, $I^2 = QI$, and I/I^2 is R/I -free. Even for the case of hypersurface rings, there seems known only scattered results which give a complete list of Ulrich ideals, except the case of finite CM-representation type and the case of several numerical semigroup rings. Therefore, in this talk, we focus our attention on a hypersurface ring which is not necessarily finite CM-representation type.
26	松井 紘樹 (東大 数 理) On the second rigidity theorem and Tor-rigidity of modules · · · · · · · · 10 Hiroki Matsui (Univ. of Tokyo) On the second rigidity theorem and Tor-rigidity of modules

概要 Torsion in tensor products of modules has been well studied by several authors with relation to Auslander—Reiten conjecture. Such a study is started by Auslander and he proved that over a regular local ring, if the tensor product of finitely generated modules is torsion-free, then these modules are Torindependent. Three decades later, Huneke—Wiegand generalized this result for hypersurface local rings. The aim of this talk is to prove a generalization of these result using n-Tor-rigid modules.

In this talk, we show that the positive and negative symbolic powers of ω are identical with the ordinary powers of ω . 宮崎充弘(京都教育大) On the generators of the canonical ideal of the Ehrhart ring of a chain On the generators of the canonical ideal of the Ehrhart ring of a chain Mitsuhiro Miyazaki (Kyoto Univ. of Edu.) polytope 概要 Let P be a finite poset, O(P) (resp. C(P)) the order polytope (resp. chain polytope) of P, $E_K[O(P)]$ (resp. $E_K[C(P)]$) the Ehrhart ring of O(P) (resp. C(P)) over a field K and $\omega_{E_K[O(P)]}$ (resp. $\omega_{E_K[C(P)]}$) the canonical ideal of $E_K[O(P)]$ (resp. $E_K[C(P)]$). In our previous work, we characterized the generators of In this talk, we characterize the generators of $\omega_{E_K[C(P)]}$. As a corollary, we show that if $E_K[C(P)]$ is level, the so is $E_K[O(P)]$. We exhibit an example that shows the converse does not hold true. We also show that, as in the case of $\omega_{E_K[O(P)]}$, the degrees of the generators of $\omega_{E_K[C(P)]}$ are consecutive integers. 大 杉 英 史 (関西学院大理工) 土谷昭善(東大数理) Hidefumi Ohsugi Enriched Hibi ring (Kwansei Gakuin Univ.) Akiyoshi Tsuchiya (Univ. of Tokyo) 概要 In 1987, Hibi introduced a class of commutative rings associated to finite partially ordered sets, which are called Hibi rings. Hibi rings are normal Cohen-Macaulay domains and Koszul. Moreover, Stanley showed that the Hilbert functions of Hibi rings coincide with some counting functions of P-partitions. In this talk, from the theory of (left) enriched P-partitions, which are introduced and studied by Stembridge and Petersen, we introduce enriched Hibi rings. In particular, we show that enriched Hibi rings are normal Gorenstein domains and Koszul, and their Hilbert functions coincide with some counting functions of left enriched P-partitions. 30 日 比 孝 之 (阪 大 情 報) Regularity and a-invariant of Cameron–Walker graphs · · · · · · · · 15 木 村 杏 子(静 岡 大 理) 松 田 一 徳 (北 見 工 大 工) 土谷昭善(東大数理) Takayuki Hibi (Osaka Univ.) Regularity and a-invariant of Cameron–Walker graphs Kyouko Kimura (Shizuoka Univ.) Kazunori Matsuda (Kitami Inst. of Tech.) Akiyoshi Tsuchiya (Univ. of Tokyo)

概要 Let S be the polynomial ring over a field K and $I \subset S$ a homogeneous ideal. Let $h(S/I, \lambda)$ be the h-polynomial of S/I and $s = \deg h(S/I, \lambda)$ the degree of $h(S/I, \lambda)$. We are interested in finding a natural class of finite simple graphs G for which S/I(G), where I(G) is the edge ideal of G, satisfies s - r = d - e, where $r = \operatorname{reg}(S/I)$, $d = \dim S/I$ and $e = \operatorname{depth} S/I$. Let a(S/I(G)) = s - d be the a-invariant of S/I. One has $a(S/I(G)) \leq 0$. In this talk, by showing the fundamental fact that every Cameron-Walker graph G satisfies a(S/I(G)) = 0, a classification of Cameron-Walker graphs G for which S/I(G) satisfies s - r = d - e will be exhibited.

概要 Let G be a finite simple graph on the vertex set $V(G) = \{x_1, ..., x_n\}$ and $I(G) \subset K[V(G)]$ its edge ideal, where K[V(G)] is the polynomial ring in $x_1, ..., x_n$ over a field K with each $\deg x_i = 1$ and where I(G) is generated by those squarefree quadratic monomials $x_i x_j$ for which $\{x_i, x_j\}$ is an edge of G. In the present paper, given integers $1 \le a \le r$ and $s \ge 1$, the existence of a finite connected simple graph G = G(a, r, s) with $\operatorname{im}(G) = a$, $\operatorname{reg}(R/I(G)) = r$ and $\operatorname{deg} h_{K[V(G)]/I(G)}(\lambda) = s$, where $\operatorname{im}(G)$ is the induced matching number of G and where $h_{K[V(G)]/I(G)}(\lambda)$ is the h-polynomial of K[V(G)]/I(G).

Futoshi Hayasaka (Okayama Univ.) Integral closure of modules over a regular local ring

概要 The theory of integrally closed ideals in a two-dimensional regular local ring was developed by Zariski. One of the main results is the product theorem, which asserts that the product of any two integrally closed ideals in a two-dimensional regular local ring is again integrally closed. Since then, the theory has been attracting interest and has been generalized to more general situations. In this talk, I will talk about such a generalization in two different directions. First, I will discuss a possibility in higher dimensional regular local ring. Then, after a brief survey on a notion of integral closure of a module and a theory of integrally closed modules over a two-dimensional regular local ring developed by Kodiyalam, I will talk about a recent result on the ubiquity of indecomposable integrally closed modules of rank two with a monomial Fitting ideal.

概要 Given an Apery-like numbers X(n) the author had once a cojecture that there hold that X(p-r) with $r=2,3,\ldots$ and p primes are congruent to $(xp-em)/q \mod p$, where e=-1 or 1 and both m and q are independent of p. If this is true then one can deduce that em are congruent to $-qX(p-r) \mod p$, which provides us with a situation of the Chinese remainder theorem. And we get a weapon for finding m,q.

概要 We study the number of integer solutions (x, y, l) of an equation $F(x, y) = \Pi_K(l)$, where F(x, y) is a homogeneous polynomial with integer coefficients and $\Pi_K(l)$ is a generalized factorial function over number fields. We show a sufficient condition for the finiteness of solutions for $F(x, y) = \Pi_K(l)$. As a corollary, we obtain the finiteness of solutions for P(x) = l!, where P is an irreducible polynomial with deg $P \geq 2$ or satisfies some condition. This corollary solves the generalized Brocard–Ramanujan problem partially.

概要 It is the famous open problem whether or not the values of the Riemann zeta-function on the critical line is dense in the complex plane. We considered an analogue problem for the function $\int_0^t \log \zeta(1/2+i\beta)d\beta$ and obtained a result that the values of this function is dense in the complex plane under the Riemann hypothesis. In this talk, we will discuss the problem for the function of iterated integral of $\log \zeta(\sigma+it)$ over the vertical line and explain the above result.

(Univ. of Tsukuba)

Koji Tasaka (Aichi Pref. Univ.)

概要 In this talk, we will discuss multiple harmonic q-series evaluated at roots of unity. The motivation to study these series comes from recent results on the connection of finite multiple zeta values (FMZV) and symmetrized multiple zeta values (SMZV). We start by giving a small introduction into the theory of multiple zeta values and then discuss their finite analogues, which were introduced by Kaneko and Zagier. After this, we introduce the notion of finite multiple harmonic q-series at roots of unity and show that these specialize to the FMZV and the SMZV through an algebraic and analytic operation, respectively. This talk is based on joint work with Y. Takeyama and K. Tasaka.

45 <u>岡野凌大</u>(東京理大理) 木田雅成(東京理大理) Ryota Okano (Tokyo Univ. of Sci.) Masanari Kida (Tokyo Univ. of Sci.) On Fourier expansions at arbitrary cusps of theta functions of binary quadratic forms with congruence conditions.

概要 For a positive definite binary quadratic form f, the theta function with a congruence condition is defined as a restricted sum by the congruence condition of the usual theta function associated to the quadratic form. By forming a certain linear combination of these theta functions, we can construct a modular form Θ on $\Gamma_0(N)$. We compute the first terms of the Fourier expansions of the modular form Θ at any cusps by means of the Gauss sums associated with the quadratic form defined by Springer. It turns out that they can be expressed in terms of classical Gauss sums under a certain mild condition.

Iterated towers of number fields by a quadratic map defined over the Gaussian rationals

Kota Yamamoto (Nagoya Inst. of Tech.)

(Nagoya Inst. of Tech.)

概要 An iterated tower of number fields is constructed by adding preimages of a base point by iterations of a rational map. A certain basic quadratic rational map defined over the Gaussian number field yields such a tower of which any two steps are relative bicyclic biquadratic extensions. Regarding such towers as analogues of a basic \mathbb{Z}_2 -extension, we examine the parity of the class numbers (and the 2-ideal class numbers) along the towers, with some examples.

概要 Any 3-dimensional affine normal quasihomogeneous SL(2)-variety, which was shown by Popov to be parameterized by two numbers, has an equivariant resolution of singularities given by an invariant Hilbert scheme. The main purpose of this talk is to provide a necessary and sufficient condition on the parameter for the invariant Hilbert scheme to be the minimal resolution of such an SL(2)-variety.

14:15~15:15 特別講演

松本雄也(東京理大理工)^b Derivations on K3 surfaces in positive characteristic Yuya Matsumoto (Tokyo Univ. of Sci.) Derivations on K3 surfaces in positive characteristic

概要 It is known that K3 surfaces admit no global derivations. However, if we allow K3 surfaces to have rational double point singularities (RDPs), then there exist many examples of K3 surfaces with global derivations, at least in small positive characteristics. Derivations D satisfying $D^p = D$ (resp. $D^p = 0$) correspond to actions of the group scheme μ_p (resp. α_p), and the quotient morphism by such derivations are purely inseparable of degree p. In the case of μ_p -actions, we can show that the quotient is a K3 surface (with RDPs) if and only if the action is symplectic in the sense that the global 2-form is invariant under the action: This is an analogue of the result of Nikulin that the quotient of a K3 surface in characteristic 0 by a finite group action is a K3 surface (with RDPs) if and only if the action is symplectic. We also show that (in both cases of μ_p and α_p) the quotient singularities are related to the height of the K3 surface: This is peculiar in positive characteristic.

15:30~16:15

概要 A criterion for the existence of higher-uniruledness=lower-rationality properties, which consistute a hierarchy interpolating uniruledness and unirationality, is given. This criterion is stated in terms of some numerical condition involving the Chern classes of the tangent bundle, and the proof make use of generalized Bott towers.

概要 A weakly reflective submanifold is a minimal submanifold of a Riemannian manifold which has a certain symmetry at each point. In my talk I will introduce this notion into a class of proper Fredholm (PF) submanifolds in Hilbert spaces and show that there exist so many infinite dimensional weakly reflective PF submanifolds in Hilbert spaces. In particular each fiber of the parallel transport map is shown to be weakly reflective. These imply that in infinite dimensional Hilbert spaces there exist so many homogeneous minimal submanifolds which are not totally geodesic, unlike in the finite dimensional Euclidean case.

relation between the algebraic structure of the octonions and the Fano plane.

- 概要 We consider local isometric embeddings of 3-dimensional warped product metrics into \mathbb{R}^4 . By calculating the curvature and its covariant derivative of this metric, we first obtain a necessary condition to admit isometric embeddings of this space into \mathbb{R}^4 . Conversely, for a generic case, we show that this condition is sufficient to ensure the existence of local isometric embeddings into \mathbb{R}^4 . By solving an ordinary differential equation, we explicitly determine the form of warped product metric that can be locally isometrically embedded into \mathbb{R}^4 .
- - 概要 It is well known that Frenet frame of a spacial curve is in Euclidian Space, but L. R. Bishop propsed that other frame is in the Euclidian Space. It is called Bishop frame. This frame is very useful for describing some particular curve. In 3-dimensional Euclidean Space, Bishop considered 3 types of coefficient matrixs, one of them is the same as Frenet frame by changing basis. So we consider 4 types of frames in 4-dimentional Euclidian Space and we consider some kind of degree of strengths of frames by coefficient matrixs.

	概要 It is known that Monge–Ampère systems is a geometric formalization of Monge–Ampère equations using the theory of exterior differential systems. In this talk, we give a generalization of Monge–Ampère systems, Monge–Ampère equations and a relationship between such systems and equations.
14	小林慎一郎 (東 北 大 理) Hilbert 幾何における Monge の最適輸送問題 · · · · · · · · 15 Shinichiro Kobayashi (Tohoku Univ.) Monge mass transportation problem in Hilbert geometries
	概要 I will concentrate on the Monge mass transportation problem with distance cost. The existence of

概要 I will concentrate on the Monge mass transportation problem with distance cost. The existence of optimal transport maps in non-branching metric spaces with some lower curvature bounds has been well studied. On the other hand, it does not seem that the study of the Monge problem in the branching case is adequate. In this talk, I will show the existence of an optimal transport map for some projective metrics on a convex domain in Euclidean space. The main result is applicable to metric spaces, admitting branching geodesics, such as Hilbert geometries and bounded domains in a normed space.

概要 Based on Getzler's rescaling transformation, we obtain a formula for the heat kernel coefficients of the Dirac Laplacian on a spin manifold. One can compute them explicitly up to an arbitrarily high order by using only a basic knowledge of calculus added to the formula.

木 村 真 琴 (茨 城 大 理) Gauss map of real hypersurfaces in non-flat complex space forms and twistor space of complex 2-plane Grassmannian

Makoto Kimura (Ibaraki Univ.) Gauss map of real hypersurfaces in non-flat complex space forms and twistor space of complex 2-plane Grassmannian

概要 It is known (by B. Palmer) that for each oriented hypersurface M^n in sphere S^{n+1} , the image of the Gauss map γ of M into complex Q^n is a Lagrangian submanifold. Moreover if M^n is isoparametric, then $\gamma(M)$ is a minimal Lagrangian submanifold in Q^n . We define the Gauss map G for real hypersurfaces M^{2n-1} in complex projective space CP^n , into complex 2-plane Grassmannian $G_2(C^{n+1})$. If M is a Hopf hypersurface in CP^n , then the $\gamma(M)$ is a half dimensional 'totally complex submanifold' in $G_2(C^{n+1})$ with respect to the quaternionic Kähler structure. Hence each Hopf hypersurface in CP^n is a total space of circle bundle over a Kähler manifold $\gamma(M)$. Also we have 'converse construction' by using the twistor space of $G_2(C^{n+1})$. We have similar results for real hypersurfaces in complex hyperbolic space CH^n .

Masaki Tsukamoto (Kyushu Univ.) Mean dimension of dynamical systems and information theory

- 概要 In the late 1950's Kolmogorov discovered that Shannon's entropy can be used in ergodic theory. This is a revolutionary idea, and ever since there have been rich interactions between information theory and the study of dynamical systems. Recently we have added some new items in these interactions. A new development comes from mean dimension theory. Mean dimension is a topological invariant of dynamical systems which estimates the number of parameters per iterate for describing the orbits of dynamical systems. We have found that this dynamical invariant has the following two connections with information theory:
- (1) Mean dimension turns out to be a crucial parameter when we try to encode dynamical systems into band-limited signals, say signals of telephone line. This is reminiscent of Shannon's fundamental work on communications over band-limited channels. This discovery was used to solve a problem posed by Lindenstrauss in 1999.
- (2) Mean dimension theory is (in some sense) a topological version of rate distortion theory. Rate distortion theory is a branch of information theory describing a lossy data compression method achieving some distortion constraint. We study the minimax problem about the "rate distortion dimension" and shows that the minimax value is given by mean dimension at least for minimal dynamical systems. This is a mean dimensional analogue of variational principle known for dynamical entropy.

Yoichi Maeda (Tokai Univ.) Three-dimensional model of $SL(2,\mathbb{R})$ and visualization of $SL(2,\mathbb{Z})$ as a pattern on the cubic lattice

概要 It is known that real special linear group $SL(2,\mathbb{R})$ is embedded into the three-dimensional sphere. By the stereographic projection, every matrix in $SL(2,\mathbb{R})$ is realized as a point in the three-dimensional Euclidean space \mathbb{R}^3 . In this talk, we propose another three-dimensional model of $SL(2,\mathbb{R})$. With this model, we can visualize $SL(2,\mathbb{Z})$ as a pattern of points on cubic lattice in \mathbb{R}^3 . In this model, the set of matrices with the fixed value of trace forms a quadratic surface (hyperboloid of two sheets, double cone, or hyperboloid of one sheet) depending on the value of trace. Hyperbolic paraboloid also comes out as the surface of the fixed value of element. With these familiar surfaces, we can analyze the pattern of $SL(2,\mathbb{Z})$.

概要 Lie groups with left-invariant Riemannian metrics have provided many interesting and nice examples of Riemannian manifolds, such as Einstein or Ricci soliton. For a given Lie group, the existence and non-existence problems of some nice left-invariant Riemannian metrics are interesting. In order to attack these problems, we focus on Lie groups whose moduli spaces of left-invariant Riemannian metrics are small. In this talk, we give a classification of almost abelian Lie groups whose moduli spaces of left invariant Riemannian metrics are one-dimensional.

概要 The notion of coupled Kähler-Einstein metrics was introduced recently by Hultgren-W. Nyström. In this talk, we discuss deformation of coupled Kähler-Einstein metrics on Fano manifolds. In particular, we obtain a necessary and sufficient condition for a coupled Kähler-Einstein metric to be deformed to a coupled Kähler-Einstein metric for another close decomposition for anti-caonnical class of Fano manifolds admitting non-trivial holomorphic vector fields. This generalizes a result of Hultgren-W. Nyström.

概要 We introduce a Kähler-like almost Hermitian metric and an almost balanced metric. We prove that on a Kähler-like almost Hermitian manifold, we have an identity between the first derivative of the torsion (1,0)-tensor and the Nijenhuis tensor. By applying the identity, then we figure out what the equivalent condition of being almost balanced on a compact Kähler-like almost Hermitian manifold is. Moreover, we prove that on a compact Kähler-like almost Hermitian manifold (M^{2n}, J, g) , if it admits a positive $\partial \bar{\partial}$ -closed (n-2, n-2)-form, then g is a quasi-Kähler metric.

30 鷲 見 拳 (京 大 理) The Riemann-Roch inequality for tropical abelian surfaces · · · · · · · · · 15

Ken Sumi (Kyoto Univ.) The Riemann-Roch inequality for tropical abelian surfaces

概要 The Riemann–Roch theorem for tropical curves was shown by Gathmann–Kerber and Mikhalkin–Zharkov in 2008. It is a very interesting problem to generalize the tropical Riemann–Roch theorem to higher dimensions, while there are few results for this problem. A main obstacle to higher dimensional generalization is to define the Euler characteristic of a tropical line bundle since the higher cohomology of line bundles cannot be defined as ordinary way. In this talk, we show the Riemann–Roch inequality for tropical abelian surfaces and more results by studying global sections of line bundles over tropical tori, called tropical theta functions.

Yoshihiko Matsumoto (Osaka Univ.) Geometric analysis on asymptotically hyperbolic and complex hyperbolic spaces

概要 Asymptotically (locally) hyperbolic spaces are certain non-compact complete Riemannian manifolds with the property that the name suggests. A remarkable feature of such a space is that its boundary at infinity is naturally equipped with a conformal structure (not necessarily locally flat); it is of interest how this conformal structure affects the analytic property of the space. We can also consider asymptotically complex hyperbolic spaces, whose boundary carries a CR structure (Cauchy—Riemann structure). These two instances are actually expected to continue to (probably) an infinite number of fruitful correspondences involving various types of "parabolic geometries."

In this talk, I will try to convey general ideas about geometric analysis on asymptotically hyperbolic and complex hyperbolic spaces through discussing aspects of the "Einstein filling problem"—that is, the problem of finding such a space satisfying the Einstein equation with given conformal or CR structure on the boundary. Examples indicating the (fun and) subtleties of the problem will be presented. Of central theoretical importance is the Fredholm theorem for geometric linear elliptic differential operators due to O. Biquard, J. Lee, and J. Roth, from which some decent perturbation theorems for Einstein metrics follow. I will also propose a new approach in the complex case, which is to strengthen the filling structure by attaching compatible almost complex structures to Einstein metrics.

39 函数論

12 <u>濱 田 英 隆</u> (九州産大理工) Composition operators of α -Bloch spaces on bounded symmetric domains in \mathbb{C}^n Composition operators of α -Bloch spaces on bounded symmetric domains in \mathbb{C}^n Composition operators of α -Bloch spaces on bounded symmetric domains in \mathbb{C}^n Gabriela Kohr (Babeş-Bolyai Univ.)

概要 Let \mathbb{B}_X be a bounded symmetric domain realized as the open unit ball \mathbb{B}_X of a finite dimensional JB*-triple X. In this talk, we continue the work related to α -Bloch mappings on \mathbb{B}_X . We first show that α -Bloch spaces on \mathbb{B}_X are complex Banach spaces. Next, we give sufficient conditions for the composition operator from the α -Bloch space into the β -Bloch space to be bounded or compact. In the case that the α -Bloch space is a Bloch space, then these conditions are also necessary.

概要 In this talk, we will generalize the Bloch-type spaces and the little Bloch-type spaces to the open unit ball $\mathbb B$ of a general infinite dimensional complex Banach space by using the radial derivative. Next, we define an extended Cesàro operator T_{φ} with holomorphic symbol φ and characterize those φ for which T_{φ} is bounded between the Bloch-type spaces and the little Bloch-type spaces. We also characterize those φ for which T_{φ} is compact between the Bloch-type spaces and the little Bloch-type spaces under some additional assumption on the symbol φ . When $\mathbb B$ is the open unit ball of a finite dimensional complex Banach space X, this additional assumption is automatically satisfied.

15:45~16:45 特別講演

下 村 勝 孝 (茨 城 大 理) Caloric morphism —熱方程式の解を保つ変換—

Katsunori Shimomura (Ibaraki Univ.) Caloric morphism —Transformation preserving solutions of the heat equation—

概要 Caloric morphism is the transformation which preserves solutions of the heat equation. On Euclidean spaces, Appell transformation is the typical and essential example.

In this talk, we introduce the notion of caloric morphism on Euclidean domains and give several characterizations of caloric morphism. As a result, we can determine caloric morphisms explicitly under some conditions. The Schwarzian derivative and its related derivatives appear in the process of determination.

Next, we generalize the notion of caloric morphism to Riemannian manifolds and give a characterization theorem

Finally, we generalize caloric mophism further to semi-riemannian manifolds. This generalization reveals which property of caloric morphism depends on the positivity of the Laplacian.

概要 The inversion problem of the hyperelliptic integrals of genus 2 is important in many fields such as computation of the conformal mapping of polygons and construction of exact solutions of the geodesic equations in physics. Grant gave a function which solves the inversion problem in terms of the two-dimensional sigma function. In this talk, we derive differential equations satisfied by the function and series expansion of the function. When the curves of genus 2 deform to elliptic curves, we show that the function transforms into the Weierstrass elliptic function.

概要 The torsion module of Kähler differential forms is considered. Relations between logarithmic differential forms and logarithmic vector fields are investigated. As an application, an effective method is proposed for computing torsion differential forms associated with a hypersurface with an isolated singularity. The main ingredients of the proposed method are logarithmic vector fields and local cohomology.

high degrees

概要 A system of natural numbers $(\mathbf{a}; h) = (a_1, ..., a_{d+1}; h)$ with $gcd(a_1, ..., a_{d+1}) = 1$ is called a regular system of weights, if the characteristic function $\chi_{(\mathbf{a},h)}(T) = (T^{h-a_1}-1)...(T^{h-a_{d+1}}-1)/(T^{a_1}-1)...(T^{a_{d+1}}-1)$ is a polynomial function (after Kyoji Saito, 1986). We show the following:

Theorem. For a pair of numbers $\mathbf{a} = (a_1, ..., a_{d+1})$, there is a number VF(\mathbf{a}) such that a regular system of weights (\mathbf{a} ; h) with $h > VF(\mathbf{a})$ gives a weight system for a quasi-homogeneous complex analytic isolated singularity.

And, in Theorem 2, we the data of $\operatorname{Aut}(D_1)$ and $\operatorname{Aut}(D_2)$ for arbitrary N_1 and N_2	gs domains in \mathbb{C}^{N_1} and \mathbb{C}^{N_2} , respectively. In given proper holomorphic mapping between D_1 e determine the structure of $\operatorname{Aut}(D_1 \times D_2)$ using
22		happings between two equidimensional FBH-
	Akio Kodama (Kanazawa Univ.*) On proper holomorphic m type domains	appings between two equidimensional FBH-

概要 We introduce a new class of domains $D_{n,m}(\mu,p)$, called FBH-type domains, in $\mathbb{C}^n \times \mathbb{C}^m$, where $0 < \mu \in \mathbb{R}$ and $p \in \mathbb{N}$. In the special case of p = 1, these are just the Fock–Bargmann–Hartogs domains $D_{n,m}(\mu)$ introduced by Yamamori. In this talk we give a complete description of a given proper holomorphic mapping between two equidimensional FBH-type domains. In particular, we prove that the holomorphic automorphism group of any FBH-type domain $D_{n,m}(\mu,p)$ with $p \neq 1$ is a Lie group isomorphic to $U(n) \times U(m)$. Hence the structure of $\operatorname{Aut}(D_{n,m}(\mu,p))$ with $p \neq 1$ is essentially different from that of $\operatorname{Aut}(D_{n,m}(\mu))$.

神 本 丈(九 大 数 理) 多変数関数論におけるニュートン多面体とその応用

Joe Kamimoto (Kyushu Univ.) Newton polyhedra in several complex variables

概要 The technique of using Newton polyhedra has many significant applications in singularity theory. In this talk, we discuss some important subjects in several complex variables by using Newton polyhedra. In the strictly pseudoconvex case, as is well known, there exists local holomorphic coordinates on which the boundary can be clearly expressed. This fact plays useful roles in various analyses on strictly pseudoconvex domains; for example, construction of peak functions, boundary behaviors of the Bergman kernel and Szegö kernel, boundary behavior of squeezing functions. On the other hand, in the weakly pseudoconvex case, a serious problem is understanding what kinds of coordinates are appropriate for a given analytical issue and how to express the boundary on these coordinates. We introduce some local holomorphic coordinates through properties of the Newton polyhedron associated to the boundary and precisely investigate the two issues: determination of the D'Angelo type and boundary behavior of the Bergman kernel. We give quantitative results for these issues from simple geometrical information of the respective Newton polyhadron. Note that the above two issues can be considered as those analogous to determination of the Lojasiewicz exponent and behavior of oscillatory integrals.

- On solutions of $x^{\prime\prime}=t^{-2}x^{1+\alpha}$ with $\alpha<0$ Ichiro Tsukamoto (Toyo Univ.) 概要 As a continuation work, we consider a second order nonlinear differential equation denoted in the title. We show the domains of its solutions and have analytical expressions valid in the neighbourhoods of the ends of these domains. In this way, we clarify asymptotic behaviour of all solutions. 周期係数をもつ半分線形微分方程式の解の振動問題10 石 橋 和 葵 (広島商船高専) Kazuki Ishibashi Oscillation problems for half-linear differential equations with periodic (Hiroshima Nat. Coll. of Maritime Tech.) coefficients 概要 In this talk, we consider the damped half-linear differential equation $(\Phi_p(x'))' + a(t)\Phi_p(x') + b(t)\Phi_p(x) =$ 0, where the coefficients a and b are periodic functions; the real-valued function Φ_p is the real-valued function defined by $\Phi_p(u) = |u|^{p-2}u$ for $u \neq 0$ and $\Phi_p(0) = 0$. The purpose of this talk is to give new criteria which guarantee that all non-trivial solutions of the damped half-linear differential equation are oscillatory (or nonoscillatory). 松永秀章(阪府大理) 2つの時間遅れをもつ線形積分方程式の安定性解析10 河 野 詳 朋 Hideaki Matsunaga (Osaka Pref. Univ.) Stability analysis of solutions of a linear integral system with two delays Akitomo Kawano 概要 In this talk we consider a linear integral system with two delays. We present some necessary and sufficient conditions for the zero solution of the system to be asymptotically stable by using analysis of characteristic roots. We also investigate the limit of solutions in the critical case where the system loses its asymptotic stability. 西口純矢(東北大AIMR) ある不連続な関数微分方程式と L^p 空間における合成作用素の滑らかさ との関係・・・・・・・・・・・・・・・・・・・・・・・・・ 10 Junya Nishiguchi (Tohoku Univ.) Some discontinuous functional differential equation and its connection
 - 概要 The objective of this talk is to deepen the understanding of the connection between the continuous and smooth dependence of solutions on initial conditions and the regularity of the history functionals for retarded functional differential equations. We consider some differential equation with a single constant delay with the history space of L^p -type and obtain the above dependence result by assuming the growth rate of the nonlinearity and its derivative. The corresponding history functional is discontinuous, and it becomes clear that there are the continuity and the smoothness of the composition operators (also called the superposition operators or the Nemytskii operators) between L^p -spaces behind the dependence results.

to smoothness of composition operators in L^p -spaces

- 5 柴 山 允 瑠 (京 大 情 報) 平面 Sitnikov 問題における記号列を実現する軌道と周期軌道の存在 ・・・ 10 Mitsuru Shibayama (Kyoto Univ.) Variational construction of orbits realizing sequences in the planar Sitnikov problem
 - 概要 Using the variational method, Chenciner and Montgomery proved the existence of an eight-shaped orbit of the planar three-body problem with equal masses. Since then a number of solutions to the N-body problem have been discovered. The Sitnikov problem is a special case of the three-body problem. The system is known to be chaotic and was studied by using symbolic dynamics. We study the limiting case of the Sitnikov problem. By using the variational method, we show the existence of various kinds of solutions in the planar Sitnikov problem. For a given symbolic sequence, we show the existence of orbits realizing it. We also prove the existence of periodic orbits.
- - On asymptotic forms of slowly decaying positive solutions of second-order quasilinear ordinary differential equations with critical coefficients
 - 概要 Second-order quasilinear ordinary differential equations with critical coefficients are considered. Asymptotic forms of slowly decaying solutions of such equations are determined.
- - Tetsutaro Shibata (Hiroshima Univ.) Asymptotic behavior of oscillatory bifurcation curves of semilinear ordinary differential equations
 - 概要 We study the bifurcation problems of semilinear ordinary differential equations with special oscillatory nonlinearities. Since $\lambda = \lambda(\alpha)$ is a continuous function of $\alpha > 0$, we are interested in the global behavior of $\lambda(\alpha)$. Here, α is the maximum norm $\alpha = ||u_{\lambda}||_{\infty}$ of the solution u_{λ} associated with λ . In the main theorem, we obtain the precise asymptotic behavior of $\lambda(\alpha)$ as $\alpha \to \infty$.
- - Yumiko Takei (Kobe Univ.) On the expression of Voros coefficients for hypergeometric differential equations associated with 2-dimensional Garnier systems in terms of the topological recursion, and its applications
 - 概要 Voros coefficients are important objects in the exact WKB analysis for the global study of solutions of differential equations. In this talk I will report that the Voros coefficients for hypergeometric differential equations associated with 2-dimensional Garnier systems are given by the generating functions of free energies defined in terms of Eynard and Orantin's topological recursion.
- - 概要 Topological recursion was originally formulated as an algorithm to compute the large N expansion of correlation / partition function of matrix models from their spectral curves. I will apply the topological recursion to a family of genus 1 spectral curves, and show that the discrete Fourier transform (with respect to the period of the spectral curve) of the topological recursion partition function gives the τ -function of the first Painlevé equation. The result is based on a relationship between the topological recursion and the WKB analysis.

概要 We consider a maximization problem on the Trudinger—Moser inequality with compact term. In this talk we study condition of the compact term on existence and nonexistence.

14 長澤 壯 之 (埼玉大理工) 一般化された O'Hara エネルギーに対する余弦公式・・・・・・・・・・ 10 Takeyuki Nagasawa (Saitama Univ.) The cosine formula for generalized O'Hara energie

概要 As one of O'Hara's energies, the Möbius energy was named after its invariant property under Möbius transformations of the surrounding space. Doyle and Schramm gave an expression of the Möbius energy in terms of the cosine of conformal angle, called the *cosine formula*. Since the conformal angle is Möbius invariant, we can see easily the invariant property of the Möbius energy from the formula. In this talk, an analogue of the cosine formula holds for generalized O'Hara's energies in spite of lack of the Möbius invariant property. This newfound formula shows quantitatively how far the energy is from the Möbius invariance.

14:15~16:15

概要 We study the eigenvalue problem of the second order elliptic operator which arises in the linearized model of the periodic oscillations of a homogeneous and isotropic elastic body. The square of the frequency agrees to the eigenvalue. Therefore, analyzing the properties of the eigenvalue we can retrieve information on the frequency of the oscillations. Particularly, we deal with a thin rod with axial symmetry and clamped ends. It is known that there are many low-frequency eigenvalues corresponding to the bending mode of vibrations. We see as well that there appear mid-frequency eigenvalues corresponding to torsional and stretching modes of vibrations. We investigate the asymptotic behavior of these mid-frequency eigenvalues, we obtain a characterization formula of the limit equation when the thinness parameter tends to 0 and we give a result on the strong convergence of the corresponding eigenfunctions.

概要 In this talk, we consider the one-dimensional Schnakenberg model on the interval (-1,1) with periodic heterogeneity g(x). Let $N \ge 1$ be an arbitrary natural number. We assume that g(x) is a symmetric and periodic function, namely g(x) = g(-x) and $g(x) = g(x + 2N^{-1})$. Furthermore, we assume that g(x) > 0 and $g \in C^3(-1,1)$. We study the linear stability of N-peak symmetric stationary solutions. We reveal the effect of the periodic heterogeneity on the stability of N-peak solution. In particular, we investigate how N-peak solutions is stabilized or destabilized by the effect of periodic heterogeneity compared with the case g(x) = 1.

概要 In this talk, we consider the one-dimensional Schnakenberg model on the interval (-1,1) with heterogeneity g(x). We first construct one-peak stationary solutions. Next, we study the stability of this solution. Also, we give some condition related to the existence of one-peak solution. Since g(x) may be not symmetric on the interval (-1,1), the constructed solution may be not symmetric. In particular, we reveal the effect of the heterogeneity on the location of a concentration point and the stability.

- 18 <u>梶木屋龍治</u> (佐賀大理工) Existence of positive radial solutions for a semipositone elliptic equation Eunkyung Ko (Keimyung Univ.) Existence of positive radial solutions for a semipositone elliptic equation Eunkyung Ko (Keimyung Univ.) Existence of positive radial solutions for a semipositone elliptic equation Eunkyung Ko (Keimyung Univ.)
 - 概要 In this lecture, we study the existence of positive radial solutions for a semipositone elliptic equation with a parameter $\lambda > 0$. We give a weak and general sufficient condition on f for the existence of positive radial solutions when $\lambda > 0$ is large and for the nonexistence of positive radial solutions when $\lambda > 0$ is small.

概要 We study the existence problem for positive solutions u to the quasilinear elliptic equation

$$-\Delta_p u = \sigma u^q + \mu$$

in the sub-natural growth case 0 < q < p-1, where $\Delta_p u = \nabla \cdot (|\nabla u|^{p-2} \nabla u)$ is the *p*-Laplacian with $1 and <math>\sigma, \mu$ are nonnegative measurable functions (or measures) on \mathbb{R}^n . We construct solutions in Lorentz spaces with a sharp exponent. To derive existence of such solutions, we give estimates for generalized mutual energy of σ and μ . Our method can be applied for equations with several subnatural terms.

Naoki Sioji (Yokohama Nat. Univ.) A Korman—Ouyang—Tanaka type identity and uniqueness of positive Satoshi Tanaka (Okayama Univ. of Sci.) radial solutions of elliptic equations in annuli Kotaro Watanabe

(Nat. Defense Acad. of Japan)

概要 We study the uniqueness of positive radial solutions of

$$\Delta u(x) + f(u(x)) = 0$$
 in $A_{a,b}$, $u(x) = 0$ on $\partial A_{a,b}$,

where $N \ge 2$, $A_{a,b} = \{x \in \mathbb{R}^N : a < |x| < b\}$. By changing a variable appropriately, we can transform the problem to the following two point boundary value problem

$$v_{ss}(s) = g(s, v(s)), \quad s \in (\alpha, \beta), \qquad v(\alpha) = v(\beta) = 0.$$

We study the uniqueness of positive solution of the latter problem, and we apply it to the former problem.

Isamu Ohnishi (Hiroshima Univ.) Microscopically fine structure of the most stable stationary state in Turing patterns (Basic theorem)

概要 In 1952, Prof. A. Turing has reported a novel principle of pattern formation, so called Turing Instability nowadays, and he has theoretically shown that spatially structured pattern is created out of obvious uniformed state spontaneously. Classically and typically, RD-equation system of Activator-Inhibitor type nonlinearity is well-known to have such an interesting property. Especially, if the diffusion constant of activator is very small, then plenty of stable steady states exit (for instance, see Y. Nishiura's report in Dynamics reported 3 (new series)). Today, I reported that, if the time constant of inhibitor is also equal to 0, then the system has an effective energy by which the system can be regarded as a gradient system, and moreover, the most stable steady state is characterized by use of it. I will report it as a mathematically rigorously proved theorem which is based on the collabolation with Prof. Y. Nishiura (AIMR, Tohoku Univ.).

9:00~12:00

概要 We discuss the ergodic problem for viscous Hamilton–Jacobi equations with superlinear Hamiltonian, inward-pointing drift, and positive potential function vanishing at infinity. Under some radial symmetry of the drift and the potential outside a bounded region, we establish sharp estimates of the generalized principal eigenvalue with respect to a perturbation of the potential. It turns out that the asymptotic behavior of the generalized principal eigenvalue depends sensitively on the intensity of the inward drift as well as the decay order of the potential function.

24 藤 田 安 啓 (富 山 大 理) 浜 向 直 (北 大 理) 山 口 範 和 (富山大人間発達) Yasuhiro Fujita (Univ. of Toyama) Nao Hamamuki (Hokkaido Univ.) Norikazu Yamaguchi (Univ. of Toyama)

概要 Let $\{H_t\}$ be a Hamilton–Jacobi semigroup acting on functions that are bounded and uniformly continuous on \mathbb{R} . Let τ be the Takagi function. The Takagi function is well known as a pathological function that is everywhere continuous and nowhere differentiable on \mathbb{R} .

Our aim of this talk is to show that the flow $\{H_t\tau\}$ has a self-affine property of evolutional type inheriting a self-affine property of τ .

Hajime Koba (Osaka Univ.) Local and global solvability for advection-diffusion equation on an evolving surface with a boundary

概要 We consider the existence of local and global-in-time strong solutions to the advection-diffusion equation with variable coefficients on an evolving surface with a boundary. We show the existence of local and global-in-time strong solutions to the advection-diffusion equation. Moreover, we derive the asymptotic stability of the global-in-time strong solution.

26 高 棹 圭 介 結晶方位差を考慮した結晶粒界の発展方程式の解の存在について・・・・・・10 (京大白眉センター・京大理) 水 野 将 司 (日 大 理 エ) Keisuke Takasao On existence of a solution for some evolution equation related to grain boundary motion with dynamic lattice misorientations

概要 Recently, some evolution equation related to grain boundary motion with dynamic lattice misorientations has been proposed by Epshteyn—Liu—Mizuno. The grain boundary moves by its mean curvature with time-dependent non-local mobility function. We show the existence of the classical solutions for the evolution equation when the grain boundary is described by a graph. Key tools are a priori gradient estimates, which is derived from the so-called monotonicity formula of Huisken type. We establish the monotonicity formula for the length element of the equation.

概要 We consider the H^{-m} gradient flow of length for closed plane curves. This flow is a generalization of curve diffusion flow. For the flow, evolving curves may develop singularities in finite time even if the initial curve is smooth. Furthermore, very little appears to be known regarding sufficient conditions for global existence. Hence we investigate the large-time behavior assuming the global existence of the flow. Then we show that the evolving curve converges exponentially to a circle. To do this, we use interpolation inequalities between the deviation of curvature and the isoperimetric ratio, recently established by Nagasawa and the author.

函数方程式論 50 塚本悠暉(東工大理) A diffused interface with the advection term in a sobolev space · · · · · · 10 利根川吉廣(東 工 大 理) Yuki Tsukamoto (Tokyo Tech) A diffused interface with the advection term in a sobolev space Yoshihiro Tonegawa (Tokyo Tech) 概要 In this talk, we consider the asymptotic limit of diffused surface energy in the van der Waals-Cahn-Hillard theory when an advection term is added and the energy is uniformly bounded. We show that the limit interface as ε tend to zero is an integral varifold and the generalized mean curvature vector is determined by the advection term. As an application of our result, a prescribed mean curvature problem is solved using the min-max method. 可香谷隆(九大IMI) 接触角条件付き表面拡散方程式に対する進行波解の非一意性と非凸性に 高 坂 良 史 (神戸大海事)

ついて 10 Takashi Kagaya (Kyushu Univ.) On non-uniqueness and non-convexity of traveling waves for surface dif-Yoshihito Kohsaka (Kobe Univ.) fusion of plane curves

概要 We study the traveling waves for surface diffusion of plane curves. We consider an evolving plane curve with two endpoints which can move freely on the x-axis with generating constant contact angles. For the evolution of this plane curve governed by surface diffusion, we discuss the existence, the uniqueness and the convexity of traveling waves. The main results show that the uniqueness and the convexity can be lost depending on the conditions of the contact angles, although the existence holds for any contact angles in the interval $(0, \pi/2)$.

谷 口 雅 治 (岡山大異分野基礎研) Axisymmetric traveling fronts in balanced bistable reaction-diffusion equations 10 Masaharu Taniguchi (Okayama Univ.) Axisymmetric traveling fronts in balanced bistable reaction-diffusion equations

概要 For a balanced bistable reaction-diffusion equation, the existence of axisymmetric traveling fronts has been studied by Chen, Guo, Ninomiya, Hamel and Roquejoffre (2007). This paper gives another proof of the existence of axisymmetric traveling fronts. Our method is as follows. We use pyramidal traveling fronts for imbalanced reaction-diffusion equations, and take the balanced limit. Then we obtain axisymmetric traveling fronts in a balanced bistable reaction-diffusion equation.

31 條 昌 彦 (岡山理大理) 双曲空間上の半線形熱方程式の爆発問題 ―劣臨界 愛玲(岡山大自然) Masahiko Shimojyou Blow-up of radially symmetric solutions for a semilinear heat equation (Okayama Univ. of Sci.) on hyperbolic space Amy Poh Ai Ling (Okayama Univ.)

概要 Radially symmetric solutions of a semilinear heat equation $u_t = \Delta u + u^p$ on the hyperbolic space are considered. First universal bounds of the nonnegative solution are obtained to know the blow-up rate at the final blow-up time under the exponent p which is subcritical in the Sobolev sense. Next we derive its local blow-up profile and also analyze blow-up set of solutions.

2019/07/31 11:28作成

51 函数方程式論

概要 We consider solutions of quasilinear equations $u_t = \Delta u^m + u^p$ in \mathbb{R}^N with the initial data u_0 satisfying $0 < u_0 < M$ and $\lim_{|x| \to \infty} u_0(x) = M$ for some constant M > 0. It is known that, if 0 < m < p with p > 1, blow-up occurs only at space infinity. In this paper, we find solutions u that blow up throughout \mathbb{R}^N when m > p > 1.

Blow up of solutions for a fourth order parabolic equation with gradient nonlinearlity

概要 We consider the Cauchy problem for a fourth order semilinear parabolic equation $\partial_t u + (-\Delta)^2 u = -\nabla \cdot (|\nabla u|^{p-2}\nabla u)$ on \mathbf{R}^N , where p>2 and $N\geq 1$. In this talk we give a sufficient condition for the existence of solution u to the Cauchy problem such that its maximal existence time $T_M(u)$ is finite. We prove that, if $T_M(u) < \infty$, then the following hold:

- (a) $\|\nabla u(t)\|_{L^{\infty}(\mathbf{R}^N)}$ blows up at $t = T_M(u)$ for p > 2;
- (b) $||u(t)||_{L^{\infty}(\mathbf{R}^N)}$ blows up at $t = T_M(u)$ for 2 .

In this talk we will show you more precise statement including the lower bound of blow up rate.

53 函数方程式論

概要 This talk is concerned with the obstacle problem for a fourth order semilinear parabolic equation. Formally, the parabolic obstacle problem can be regarded as the L^2 -gradient flow for an energy functional under a constraint by the obstacle. However, since the obstacle generally causes a lack of regularity of solutions, it is not clear that the obstacle problem has a gradient structure of the energy functional. In this talk, we prove that (i) the obstacle problem possesses a unique weak solution; (ii) the weak solution has the L^2 -gradient structure for the energy functional in a weak sense.

概要 This talk is concerned with solvability of a quasilinear degenerate chemotaxis system with flux limitation. In a special setting Bellomo–Winkler proved local existence of unique classical solutions and extensibility criterion ruling out gradient blow-up as well as global existence and boundedness of solutions in 2017. However, a general setting has not been considered yet. The purpose of the present talk is to derive local existence and extensibility criterion ruling out gradient blow-up in a slightly general setting, and moreover to show global existence and boundedness of solutions under some conditions.

概要 This talk is concerned with blow-up of solutions to a quasilinear degenerate chemotaxis system with flux limitation. In a special setting Bellomo—Winkler found initial data such that a corresponding solution blows up in finite time in 2017. On the other hand, recently, local existence and extensibility criterion ruling out gradient blow-up in a general setting was proved; however, blow-up solutions in the general setting has not been studied yet. The purpose of the present talk is to give some conditions for existence of blow-up solutions in the general setting.

概要 We consider the Cauchy problem for an attraction-repulsion chemotaxis system in the whole space: $\partial_t u = \Delta u - \nabla \cdot (u\nabla(\beta_1 v_1 - \beta_2 v_2)), \ 0 = \Delta v_1 - \lambda_1 v_1 + u, \ 0 = \Delta v_2 - \lambda_2 v_2 + u$, where the constants β_1 , β_2 , λ_1 , λ_2 are positive and the initial data u_0 is nonnegative. In this talk we will discuss the global existence and blow up for this system under the condition $\beta_1 = \beta_2$.

	Haruya Mizutani (Osaka Univ.)	Wave operator on Sobolev space

概要 We provide a simple sufficient condition in an abstract framework to deduce the existence and completeness of wave operators on the scale of Sobolev spaces from the existence and completeness of the ordinary wave operators. Some applications to the potential scattering on the Euclidean space as well as the scattering for a nonlinear Schrödinger equation with a linear potential are also discussed. The class of potentials satisfying our condition in case of the Sobolev space of order one includes short-range potentials with subcritical singularities, the inverse-square potential and the 1D delta type point interaction.

$14:15\sim16:15$

田中智之

- - 概要 As a generalization of Carlson's problem, Cho–Lee–Vargas considered the pointwise convergence problem for the solution of the standard Schrödinger equation along directions determined by a given compact subset of the real line. We simplify and extend their result to fractional Schrödinger equations by avoiding the use of a time localization lemma.
- - 概要 We determine the H^s wave front sets of solutions to time dependent Schrödinger equations with a sub-quadratic potential by using the characterization of the H^s wave front set in terms of wave packet transform which is obtained by K. Kato, M. Kobayashi, and S. Ito (2017).

Parabolic smoothing effect for higher order linear Schrödinger type

- - 概要 We establish the energy estimate for higher order linear Schrödinger type equations on the torus. The proof is based on the energy method with correction terms, but some derivative losses cannot be recovered and they may have an affect on the well-posedness. As a corollary, we can classify the Cauchy problem into three types: dispersive type, parabolic type and ill-posed type.

Masayuki Hayashi (Kyoto Univ.) Characterization of 4π -mass condition for the derivative nonlinear Schrödinger equation

概要 We consider the derivative nonlinear Schrödinger equation (DNLS) which has L^2 -critical and completely integrable structure. It is known that if the initial data $u_0 \in H^1(\mathbb{R})$ satisfies $||u_0||_{L^2}^2 < 4\pi$, the corresponding solution is global and bounded. The main aim of this talk is to characterize this 4π -mass condition from potential well theory. We see that the mass threshold value 4π gives the turning point in the structure of potential well generated by solitons. Our approach is applicable to more general equation which contains DNLS.

16:30~17:30 特別講演

小野寺有紹 (東 工 大 理) b Hyperbolic solutions to Bernoulli's free boundary problem Michiaki Onodera (Tokyo Tech) Hyperbolic solutions to Bernoulli's free boundary problem

概要 Bernoulli's free boundary problem is an overdetermined problem in which one seeks an annular domain such that the capacitary potential satisfies an extra boundary condition. This problem arises as the Euler—Lagrange equation for minimizing the capacity among all subsets of equal volume in a prescribed container. There exist two different types of solutions: elliptic and hyperbolic solutions. Elliptic solutions are "stable" solutions and tractable by variational methods and maximum principles, while hyperbolic solutions are "unstable" solutions of which the qualitative behavior is less known. I will present an implicit function theorem based on the parabolic maximal regularity, which enables us to handle the so-called loss of derivatives without losing the regularity of solutions. As an application, we prove the existence of a foliated family of hyperbolic solutions.

概要 We consider the local well-posedness for the higher-order generalized KdV type equation with low-degree of nonlinearity. The equation arises as a non-integrable and lower nonlinearity version of the higher-order KdV equation. As for the lower nonlinearity model of the KdV equation, Linares, Miyazaki and Ponce prove the local well-posedness under a non-degenerate condition introduced by Cazenave and Naumkin (2017). In this talk, we show that the well-posedness result can be extended into the higher-order equation. We also give a lower bound for the lifespan of the solution. The lifespan depends on two quantities determined by the initial data.

4 2 非線形項に 2 階の微分を含む KdV 型方程式の適切性について 10 (宮崎大テニュアトラック推進機構) 本 下 真 也 (Univ. Bielefeld) 岡 本 葵 (信 州 大 工) Hiroyuki Hirayama (Univ. of Miyazaki) Shinya Kinoshita (Univ. Bielefeld) Mamoru Okamoto (Shinshu Univ.) Well-posedness for KdV type equation with second derivative nonlinearity

概要 We consider the KdV type equation which contains the quadratic second derivative nonlinearity. Because the derivative loss occurs from the nonlinear term, the well-posedness in the Sobolev space $H^s(\mathbb{R})$ cannot be obtained by using the iteration argument. Harrop and Griffiths (2015) proved the well-posedness of this equation in the translation invariant Sobolev space $l^1H^s(\mathbb{R})$ for s > 5/2. To improve this result, we use the gauge transform which was used by Ozawa (1998) for the quadratic derivative nonlinear Schrödinger equation. We prove the well-posedness of the KdV type equation in \mathcal{X}^s for $s \geq 1$, where \mathcal{X}^s is the space of functions in $H^s(\mathbb{R})$ with bounded primitives.

概要 We consider the Cauchy problem of the 2D Zakharov-Kuznetsov equation. Our aim is to show the well-posedness in a low regularity Sobolev space. In the proof of the crucial nonlinear estimate resonant interactions appear. Since their shape is very complicated (due to the linear part of Zakharov-Kuznetsov equation), it is challenging to treat all of them. To overcome this, we employ a nonlinear version of the Loomis-Whitney inequality and a suitable Whitney decomposition.

62 加藤 勲 (京 大 理) b The bilinear estimates for the Zakharov type system · · · · · · · · · · 10

Isao Kato (Kyoto Univ.) The bilinear estimates for the Zakharov type system

概要 In this talk, we consider the Cauchy problem for the degenerated Zakharov system. The degeneracy means lack of dispersion in one direction in the Schrödinger equation. In contrast to the Zakharov system, the degenerated Zakharov system is not so much studied yet for complexity of the nonlinear interaction. Barros-Linares (2015) showed local well-posedness of this system in certain Sobolev space by the linear estimate (the Strichartz estimate and the maximal function estimate), so they assume high regularity. The aim of this work is lower the regularity than Barros-Linares in the framework of the Fourier restriction norm method.

	for the damped wave equation	with a nonlinear convection term. We assume that the initial data decay
	polynomially at spatial infinity.	When the initial data decay fast enough, it is known that the solution to

for the damped wave equation with a nonlinear convection term. We assume that the initial data decay polynomially at spatial infinity. When the initial data decay fast enough, it is known that the solution to this problem converges to a self-similar solution to the Burgers equation called a nonlinear diffusion wave and its optimal asymptotic rate is obtained. In this talk, we focus on the case that the initial data decay more slowly than previous works and derive the corresponding asymptotic profile. Moreover, we investigate how the change of the decay rate of the initial values affect its asymptotic rate.

概要 We study the asymptotic behavior of the solution to a generalized Rosenau equation that is of regularity-loss type. Due to its structure, the solution behaves differently from the solutions of wave equations with a lower order damping term. In this talk, the author gives a new expanding method for the solution in the high-frequency region.

70 川 越 大 輔 (京 大 情 報) 定常輸送方程式の解に対する $W^{1,p}$ 評価 \cdots 10 Daisuke Kawagoe (Kyoto Univ.) $W^{1,p}$ estimate for the solution to the stationary transport equation

概要 We consider a boundary value problem of the stationary transport equation in a two dimensional bounded convex domain with the incoming boundary condition. In this talk, we give a $W^{1,p}$ estimate of the solution to the boundary value problem with $1 \le p < p_m$, where $W^{1,p}$ is the standard Sobolev space and p_m is a real number depending only on the shape of the domain. Moreover, we show two examples which implies that this estimate is optimal in some cases. This $W^{1,p}$ estimate for the solution is important when we discuss reliability of numerical solutions to the boundary value problem obtained by discrete-ordinate discontinuous Galerkin methods.

	概要 We consider the linearize	ed problem for the Navier–Stokes equation around the solution for the

概要 We consider the linearized problem for the Navier—Stokes equation around the solution for the Rayleigh—Plesset equation. Here the Rayleigh—Plesset equation is an ordinary differential equation with respect to time whose solution describe the dynamics of spherical bubble. Since the Rayleigh—Plesset equation is derived from the Navier—Stokes equation, we can describe one of the solution of the Navier—Stokes equation by the solution of the Rayleigh—Plesset equation. Then we show a local existence of the unique solution of the linearized problem for Navier—Stokes equation around the solution of Rayleigh—Plesset equation.

概要 We consider the compressible Navier-Stokes-Korteweg system describing the dynamics of a liquid-vapor mixture with diffuse interphase. The global solutions are established under linear stability conditions in critical Besov spaces. In particular, the sound speed may be greater than or equal to zero. By fully exploiting the parabolic property of the linearized system for all frequencies, we see that there is no loss of derivative usually induced by the pressure for the standard isentropic compressible Navier-Stokes system. This enables us to apply Banach's fixed point theorem to show the existence of global solution. Furthermore, we obtain the optimal decay rates of the global solutions in the $L^2(\mathbb{R}^d)$ -framework.

概要 We consider the initial boundary value problem for a compressible viscoelastic system with time-periodic external force in an infinite layer. There exists a time-periodic parallel flow if the external force has a suitable condition. We show that if the initial perturbation is sufficiently small, the time-periodic parallel flow is asymptotically stable, provided that the Reynolds and the Mach numbers are small and the propagation speed of the shear wave is large.

概要 We consider 2-dimensional doubly diffusive convection problem for artificial compressible system. The incompressible Navier—Stokes system is obtained as a singular limit with zero Mach number which is included in the artificial compressible system. It is known for the incompressible system that if the bifurcation parameter increases beyond a certain critical value, then the motionless state becomes unstable and a time periodic flow bifurcates. In this talk, we show that there also exists a bifurcating time periodic solution for the artificial compressible system when the Mach number is sufficiently small.

16:30~17:30 特別講演

若 杉 勇 太 (愛媛大理工) 消散型波動方程式に対する LP-Lq 評価と非線形問題への応用

Yuta Wakasugi (Ehime Univ.) $L^{p}-L^{q}$ estimates for the damped wave equation and their application to nonlinear problems

概要 The asymptotic behavior of solutions to the damped wave equation has been studied for a long time after a pioneering work by Matsumura (1976). He proved L^p - L^q estimates for the damped wave equation (so-called Matsumura estimates) and applied them to semilinear problems. After that, Nishihara (2003) discovered a decomposition of the solution into the heat part and the wave part, which gives a refined L^p - L^q estimates. In this talk, we give a survey of the study of the asymptotic behavior of solutions to the damped wave equation, and show sharp L^p - L^q estimates with derivative loss. Moreover, as an application of L^p - L^q estimates, we consider the Cauchy problem of the nonlinear damped wave equation with slowly decaying initial data. In particular, we give a small data global existence result including the case of critical nonlinearity. This result is based on a joint work with M. Ikeda, T. Inui, and M. Okamoto. At the end of the talk, as another application, we also introduce Strichartz estimates for the damped wave equation including the endpoint case. This part is based on a joint work with T. Inui.

15 水 上 雅 昭 (東京理大理) How far does small chemotactic interaction perturb the Lotka-Volterra competition dynamics on bounded convex domains? · · · · · · · 15

Masaaki Mizukami How far does small chemotactic interaction perturb the Lotka-Volterra competition dynamics on bounded convex domains?

概要 This work is concerned with the question that "how far does small chemotactic interaction perturb the Lotka-Volterra competition dynamics?". A two-species chemotaxis-competition system was studied by e.g., Bai-Winkler (2016) and Lin-Mu-Wang (2015). However, there are still many open problems about the two-species chemotaxis-competition system. On the other hand, the Lotka-Volterra competition system has been studied extensively. Thus the development of this work will enable us to see new properties of solutions for the chemotaxis system. The main result of this talk gives convergence of solutions for the two-species chemotaxis-competition system to those for the Lotka-Volterra competition system on bounded convex domains.

Shunsuke Kurima (Tokyo Univ. of Sci.) Employing a time discretization scheme for a simultaneous abstract evolution equation applying to parabolic-hyperbolic phase-field models

概要 This talk deals with a simultaneous abstract evolution equation. This includes a parabolic-hyperbolic phase field system as an example which has studied by e.g., Grasselli-Petzeltová-Schimperna (2006) and Wu-Grasselli-Zheng (2007). Although a time discretization of an abstract evolution equation has been studied by e.g., Colli-Favini (1996), time discretizations of simultaneous abstract evolution equations seem to be not studied yet. In this talk we focus on a time discretization of a simultaneous abstract evolution equation applying to parabolic-hyperbolic phase field systems. Moreover, we can establish an error estimate for the difference between continuous and discrete solutions.

概要 We consider the uniform boundedness for global solutions of nonlinear heat equations with nonlinear boundary conditions. As for the Dirichlet boundary conditions, there are many studies on the uniform bounds for global solutions by Ôtani, Cazenave—Lions, Giga, Quittner and so on. However, it does not work these methods for the nonlinear boundary condition case due to the nonlinearity on the boundary. In this talk, we modify the abstract theory on the asymptotic behavior for global solutions by Ôtani (1981) and show that global solutions are bounded uniformly in time in appropriate norm.

概要 In this talk, we consider the time-periodic problem for the complex Ginzburg-Landau equation (CGL):

$$\frac{du}{dt}(t,x) - (\lambda + i\alpha)\Delta u - (\kappa + i\beta)|u|^{q-2}u - \gamma u = f(t,x),$$

where $\lambda, \kappa > 0$ and $\alpha, \beta, \gamma \in \mathbb{R}$ and $f: (0, T) \times \Omega \to \mathbb{C}$ denotes an external force with a given period T > 0. We identify \mathbb{C} with \mathbb{R}^2 and formulate (CGL) as an evolution equation governed by subdifferential operators in product Lebesgue space $\mathbb{L}^2 := \mathbb{L}^2 \times \mathbb{L}^2$, which is a Hilbert space. We show the existence of time-periodic solutions of (CGL) in bounded domains with assuming suitable smallness of f and γ by modifying the argument developped in Ôtani (1984).

Keiichiro Kagawa (Waseda Univ.) Time periodic problem for the viscous Cahn-Hilliard equation with the homogeneous Dirichlet boundary condition

概要 We consider the time periodic problem for the viscous Cahn-Hilliard equation with the homogeneous Dirichlet boundary condition. There are no results on this problem, except the work by Liu-Liu-Tang (2013) for the special case of Cahn-Hilliard equation. In this talk, we show the existence of the time periodic solutions by using Schauder fixed point theorem.

概要 In this talk, we consider a coupled system of the Kobayashi-Warren-Carter type, including the singular diffusion and dynamic boundary condition. The system is known as the mathematical model of grain boundary motion in a polycrystal, proposed by [Kobayashi et al., Physica D, 140 (2000), 141–150]. The objective of this study is to develop the mathematical theories which enable us to apply the mathematical observations for the grain boundary motion under various situations. Based on this, we set the goal to obtain the solvability of the system, including the representations of the solution.

Makoto Okumura (Osaka Univ.) The existence and uniqueness for a structure-preserving scheme of the Cahn–Hilliard equation with a dynamic boundary condition

概要 We propose a structure-preserving scheme for the Cahn-Hilliard equation with a dynamic boundary condition by using the discrete variational derivative method (DVDM). In this method, how to discretize the energy which characterizes the equation, it is essential. Modifying the conventional manner and using another summation-by-parts formula, we can use the central difference operator as an approximation of an outward normal derivative on the discrete boundary condition of the proposed structure-preserving scheme. In this talk, we focus on the existence and uniqueness of the solution for the scheme.

Hiroshi Watanabe (Oita Univ.) Traveling wave solutions to one-dimensional initial value problems for scalar parabolic-hyperbolic conservation laws

概要 We consider one-dimensional Cauchy problems (CP) for scalar parabolic-hyperbolic conservation laws. The equation is regarded as a linear combination of the hyperbolic conservation laws and the porous medium type equations. Thus, this equation has both properties of hyperbolic equations and those of parabolic equations. Accordingly, it is difficult to investigate the behavior of solutions to (CP). In this talk, we focus our attention on traveling wave solutions to (CP). More precisely, we construct concrete discontinuous traveling wave solutions and discuss the properties of its. Moreover, we show the qualitative properties for entropy solutions to (CP) using the modified traveling wave solutions.

Kota Kumazaki (Nagasaki Univ.) Global solvability of a multiscale model describing moisture transport in porous materials

概要 In the previous works, we proved the existence of a locally-in-time solution for a multiscale model which is given as a mathematical model describing moisture transport in porous materials. Our model consists of a diffusion equation of the relative humidity in a macro domain and the free boundary problems describing a wetting and drying process in infinite micro domains. In this talk, under the improvement of the diffusion equation of the relative humidity based on the experimental result, we discuss the global existence of a solution for our multiscale model.

概要 In this talk, we discuss the parabolic problem for the hardening phenomena. The unknown functions u and σ describe the displacement and stress, respectively in the one-dimensional interval. Our problem means the hardening problem that the materials are harden by plasticity. That is derived from the hardening model by Visintin (2006), and the perfect plasticity model by Duvaut-Lions (1976). In the perfect plasticity model, the function that is threshold value in the plastic deformation, is a constant. In this talk, we discuss the solvability for the above model with the threshold function depending upon time or unknown function, based on the idea of Duvaut-Lions (1976).

	<u>Takeshi Fukao</u> (Kyoto Univ. of Edu.) Pierluigi Colli (Pavia Univ.)	On a transmission problem for equation and dynamic boundary condition of Cabn—Hilliard type
	Hao Wu (Fudan Univ.)	v 1

概要 In this talk, we discuss the well-posedness of a transmission problem for equation and dynamic boundary condition of Cahn-Hilliard type. This problem is a sort of Cahn-Hilliard system with dynamic boundary condition, which is one of the current topics. Volume conservations in the bulk and on the boundary are the point of emphasis. For this transmission problem, the well-posedness is discussing under the prototype settings of double well potentials, recently. In this study we extend the result for wider setting of maximal monotone graphs. Based on the time-discretization and suitable approximate problem, we can find the approximate solution and discuss the convergence to the target problem.

31	白 川 健	(千葉大教育)。	Optimal control problem for one-dimensional semi-discrete system of Kobayashi–Warren–Carter type · · · · · · 15
	Ken Shirakawa	(Chiba Univ.)	Optimal control problem for one-dimensional semi-discrete system of Kobayashi–Warren–Carter type

概要 In this talk, we consider a class of optimal control problems for state problems of one-dimensional semi-discrete systems. Each state problem is denoted by $(S)_{\varepsilon}$, with $\varepsilon > 0$, and is associated with the phase-field model of grain boundary motion, proposed by [Kobayashi et al.; Phys. D, 140 (2000), 141–150]. In this regard, each optimal control problem is denoted by $(OCP)_{\varepsilon}$, with $\varepsilon > 0$, and it is prescribed as a minimization problem of a cost. Additionally, the problems $(S)_{\varepsilon}$ and $(OCP)_{\varepsilon}$ are supposed to admit limiting profiles as $\varepsilon \downarrow 0$, and then, the limiting problems are supposed to contain no little singularityies In this talk, the main interest is in the case when $\varepsilon > 0$ (regular case), and the mathematical results concerned with the existence of the optimal control when $\varepsilon > 0$; (b) the necessary condition for the regular optimal control; (c) limiting observation as $\varepsilon \downarrow 0$; will be reported as the main theorems of this talk.

概要 We consider the scattering theory for one-dimensional two-state quantum walks. The S-matrix appears in the Fourier transform of the scattering operator associated with the position-dependent QWs. Usually, the scattering operator is defined by the wave operator in a time-dependent manner. In this talk, we consider the spectral theory for QW in the time-independent argument. Moreover, we show that the S-matrix appears in the singularity expansion of the generalized eigenfunction in $\ell^{\infty}(\mathbf{Z}; \mathbf{C}^2)$.

概要 It is recently shown by A. Suzuki (Shinshu University) that chirally symmetric discrete-time quantum walks possess supersymmetry, and that their associated Witten indices can be naturally defined. Such quantum walks are referred to as supersymmetric quantum walks (SUSYQWs). In this talk, we are going to consider a well-known one-dimensional two-phase model (split-step quantum walk) as a prototype example of a SUSYQW. A complete classification of the Witten index associated with this model will be given. *This is joint work with A. Suzuki.

Yoshihisa Miyanishi (Osaka Univ.) The spectral theory of the Neumann–Poincaré operator and its applications

概要 The Neumann–Poincaré operator (abbreviated by NP) is a boundary integral operator naturally arising when solving classical boundary value problems using layer potentials. If the boundary of the domain, on which the NP operator is defined, is $C^{1,\alpha}$ smooth, then the NP operator is compact. Thus, the Fredholm integral equation, which appears when solving Dirichlet or Neumann problems, can be solved using the Fredholm index theory.

Regarding spectral properties of the NP operator, the spectrum consists of eigenvalues converging to 0 for $C^{1,\alpha}$ smooth boundaries. Our main purpose here is to deduce eigenvalue asymptotics of the NP operators in three dimensions. This formula is the so-called Weyl's law for eigenvalue problems of NP operators. Then we discuss relationships among the Weyl's law, the Euler characteristic and the Willmore energy on the boundary surface. Furthermore, we present the asymptotic behavior of positive and negative NP eigenvalues separately under the condition of infinite smoothness of the boundary in three dimensions.

As an application, we analyze the localized surface plasmon resonance via the spectral theory of the NP operator. This is a particular class of metamaterials that allow the presence of negative material parameters such as negative permittivity and permeability in electromagnetism, and negative density and refractive index in acoustics, etc. Brief observations of NP operators reveal the mathematical meaning of these phenomena.

9:00~12:00

概要 The quantum Rabi model (QRM), and its generalization, asymmetric quantum Rabi model (AQRM), are the simplest models used in quantum optics to describe the interaction of light and matter. Both models were shown to be integrable in 2011 by showing the existence of a G-function whose zeros correspond to a part of the spectrum of QRM. We show that the remaining eigenvalues, called exceptional correspond to removable singularities of the G-function for certain values of the parameters. In the general case, we define a complete G-function that captures the complete spectrum of QRM. Moreover, we show that this completed G-function is, up to an entire non-vanshing function, equal to the spectral determinant of the QRM, defined in terms of the zeta regularized product of its spectral zeta function.

	Cid Reyes-Bustos (Tokyo Tech) Masato Wakayama (Kyushu Univ.)	Heat kernel and spectral zeta function of the quantum Rabi model

概要 The quantum Rabi model (QRM) is one of simplest and most fundamental systems describing quantum light-matter interaction. In this talk we give a closed form of the heat kernel of the Hamiltonian of the QRM using the Trotter-Kato product formula. To the best knowledge of the authors, this is the first explicit derivation of the heat kernel for any non-trivial interacting quantum system. From the explicit expression of the heat kernel we also obtain a formula for the partition function of the QRM. As an application, we investigate basic properties of the spectral zeta function for the QRM via the Mellin transform of the partition function of the QRM.

亮 (有明工高専) 対称関数と immanant 恒等式 · · · · · · · · · · · · · · · · · · 15 19 田端 Ryo Tabata (Ariake Nat. Coll. of Tech.) Symmetric functions and immanant identities

概要 The immanant of a matrix is a generalization of both the determinant and the permanent in terms of the representations of the symmetric group. Since the discovery of the correspondence between the product of Schur functions and the minor expansion of immanants, it has played the important role in the representation theory and the invariant theory, etc.

In this talk, we consider some immanant identities corresponding to plethysm, another type of the product of Schur functions, which arises in the representations of the general linear group. Following Littlewood's approach, we review invariant matrices and the contribution of immanants to the plethysm. We give the immanant identities corresponding to the most simplest formula of the plethysm, and discuss more general cases.

Yuichiro Tanaka (Univ. of Tokyo) Visible actions on complex spherical varieties and some applications

概要 With the aim of uniform treatment of multiplicity-free representations of Lie groups, T. Kobayashi introduced the notion of visible actions on complex manifolds in the early 2000s. As an application of his propagation theorem of multiplicity-freeness property we can find that if a Lie group acts on a connected complex manifold strongly visibly then the space of holomorphic functions is multiplicity-free. I will show that the converse holds in an algebraic setting, namely, a complex spherical variety admits a strongly visible action of a compact real form.

This result and its proof have several applications. Huckleberry and Wurzbacher (1990) proved that for a connected compact Kähler manifold with a Kähler–Poisson action of a connected compact Lie group U the U-action is coisotropic if and only if it is an embedding of a complex spherical variety. Hence in this setting we can see that the coistropicity implies the visibility.

The proof of the visibility for spherical varieties has an application to harmonic analysis on Riemannian weakly symmetric spaces. By the same argument as the proof of the visibility in the affine homogeneous case we can show a KAK-decomposition for Gelfand pairs and from this we obtain an induction formula of spherical functions.

We also have an application to double coset decompositions. Again by the same argument we can show a Cartan decomposition for a real spherical reductive homogeneous space as conjectured by Kobayashi (1995). Further, we can describe generic double cosets with respect to pairs of absolutely spherical reductive subgroups under some conditions by using T. Matsuki's results on double coset decompositions for symmetric pairs (1995).

25 松 本 健 吾 (上 越 教 育 大) Subshifts, λ -graph bisystems and their C^* -algebras · · · · · · · · · · · · 15 Kengo Matsumoto Subshifts, λ -graph bisystems and their C^* -algebras (Joetsu Univ. of Edu.)

概要 We introduce a notion of λ -graph bisystem, that consists of a pair $(\mathfrak{L}^-, \mathfrak{L}^+)$ of two labeled Bratteli diagrams $\mathfrak{L}^-, \mathfrak{L}^+$, respectively, and satisfy certain compatibility condition of their labeling on edges. It yields a pair of C^* -algebra written $\mathcal{O}^+_{\mathfrak{L}^-}, \mathcal{O}^-_{\mathfrak{L}^+}$. If a λ -graph bisystem comes from a λ -graph system of a finite directed graph, then $\mathcal{O}^+_{\mathfrak{L}^-}$ is isomorphic to \mathcal{O}_A , whereas $\mathcal{O}^-_{\mathfrak{L}^+}$ is isomorphic to $C(\Lambda_A) \times_{\sigma_A^*} \mathbb{Z}$ of the two-sided topological Markov shift (Λ_A, σ_A) .

概要 The Cuntz-Toeplitz algebra is a C*-algebra generated by isometries with mutually orthogonal ranges. We consider the automorphism group of the Cuntz-Toeplitz algebra and compute its homotopy groups. In this talk, we would like to introduce the above result and explain its relation between M. Dadarlat's work about Cuntz algebras.

	Masayuki Watanabe (Maebashi Inst. of Tech.)	

概要 Let A and B be strictly positive operators on a Hilbert space, $n \in \mathbb{N}$ and $x \in \mathbb{R}$. A path $A
abla_x B \equiv A^{\frac{1}{2}} (A^{\frac{-1}{2}} B A^{\frac{-1}{2}})^x A^{\frac{1}{2}}$ passing through A and B. We have defined the n-th relative operator entropy $S^{[n]}(A|B) \equiv \frac{1}{n!} A^{\frac{1}{2}} (\log A^{\frac{-1}{2}} B A^{\frac{-1}{2}})^n A^{\frac{1}{2}}$ and the n-th Tsallis relative operator entropy $T_x^{[1]}(A|B) \equiv \frac{A
abla_x B - A}{x}$ and $T_x^{[n]}(A|B) \equiv \frac{T_x^{[n-1]}(A|B) - S^{[n-1]}(A|B)}{x}$ for $n \geq 2$. We have also introduced the n-th Petz–Bregman divergence $D_{FK}^{[n]}(A|B) \equiv T_1^{[n]}(A|B) - S^{[n]}(A|B)$. In this talk, we regard the differences between the n-th relative operator entropies as n-th operator divergences and show relations between these n-th operator divergences and the n-th Petz–Bregman divergence.

藤 井 正 俊 (大阪教育大*) 作用素幾何平均に纏わる不等式について

Masatoshi Fujii (Osaka Kyoiku Univ.*) Some inequalities on operator geometric mean

概要 Throughout this talk, an operator A means a bounded linear operator acting on a complex Hilbert space H. An operator A is positive, denoted by $A \ge 0$, if $(Ax, x) \ge 0$ for all $x \in H$. We denote A > 0 if A is positive and invertible. The α-geometric mean $\#_{\alpha}$ for $\alpha \in [0, 1]$ is defined by $A\#_{\alpha}B = A^{\frac{1}{2}}(A^{-\frac{1}{2}}BA^{-\frac{1}{2}})^{\alpha}A^{\frac{1}{2}}$ for A > 0 and $B \ge 0$.

The core of log-majorization theorem due to Ando-Hiai is that $A\#_{\alpha}B \leq 1$ implies $A^r\#_{\alpha}B^r \leq 1$ for $r \geq 1$. It holds for positive operators A, B on a Hilbert space, and is called the Ando-Hiai inequality (AH). A binary operation \natural_{α} is defined by the same formula as the α -geometric mean for $\alpha \notin [0,1]$. Very recently (AH) is extended by Seo as follows: For $\alpha \in [-1,0]$, $A\natural_{\alpha}B \leq 1$ for A, B > 0 implies $A^r\natural_{\alpha}B^r \leq 1$ for $r \in [0,1]$.

In this talk, we present two variable extension of it. As an application, we pose operator inequalities of type of Furuta inequality and grand Furuta inequality. Moreover, related to them, we propose norm inequalities of Bebiano–Lemos–Providência type.

	概要 Recently, some researchers have started to study the limit sets (for short, fractals) generated by non-autonomous iterated function systems (for short, NAIFSs). However, the NAIFSs in such studies are generated by the functions defined on some compact set, which deduces that the fractals are always uniformly bounded with respect to the base points. In this talk, we consider the NAIFSs generated by the functions defined on a complete metric space and we construct the fractals (which are not uniformly bounded with respect to the base points in general) generated by the NAIFSs. In addition, we discuss some basic properties of the fractals.

The scaling limit is a multidimensional version of Lamperti's generalized arcsine distribution, which is the joint-law of occupation times of a skew Bessel diffusion processes moving on multiray.

5 村山拓也(京 大 理) Loewner chains and evolution families on parallel slit half-planes · · · · · 15
Takuya Murayama (Kyoto Univ.) Loewner chains and evolution families on parallel slit half-planes

概要 In this talk, we shall consider a generalization of the Loewner equation to parallel slit half-planes. This equation describes the evolution of conformal mappings and, these days, is paid much attention due to the great success of Schramm-Loewner evolution (SLE). SLE is now extended toward two directions: One direction is to consider multiple SLE paths simultaneously, and the other is to consider SLE on multiply connected domains. In view of the modern Loewner theory in complex analysis, we shall discuss a framework broad enough to include both the directions by establishing the Komatu-Loewner equation with measure-valued driving sources. One of our key tools is Brownian motion with darning (BMD).

概要 In this talk, we consider the so-called frog model with random initial configurations, which is described by the following evolution mechanism of simple random walks on the multidimensional cubic lattice: Some particles are randomly assigned to any site of the multidimensional cubic lattice. Initially, only particles at the origin are active and they independently perform simple random walks. The other particles are sleeping and do not move at first. When sleeping particles are hit by an active particle, they become active and start doing independent simple random walks. We observe how initial configurations affect the asymptotic shape of the set of all sites visited by active particles up to a certain time, and present the continuity for the asymptotic shape in the law of the initial configuration.

Finding optimal solutions by stochastic cellular automata Satoshi Handa (Fujitsu Laboratories Ltd.) Katsuhiro Kamakura (Hokkaido Univ.)

Akira Sakai (Hokkaido Univ.)

概要 Finding a ground state of a given Hamiltonian is an important. One of the potential methods is to use a Markov chain Monte Carlo (MCMC) to sample the Gibbs distribution whose highest peaks correspond to the ground states. In this talk, we use stochastic cellular automata (SCA) and see if it is possible to find a ground state faster than the Glauber dynamics. We show that, if the temperature is sufficiently high, it is possible for SCA to have more spin-flips per update in average than Glauber and, at the same time, to have an equilibrium distribution "close" to the Gibbs distribution. We also propose a new way to characterize how close a probability measure is to the target Gibbs.

 - 概要 We studied the bail-out optimal dividend problem with regime switching under the constraint that the cumulative dividend strategy is absolutely continuous. We confirm the optimality of the regime-modulated refraction-reflection strategy when the underlying risk model follows a general spectrally negative Markov additive process. To verify the conjecture of a barrier type optimal control, we first introduce and study an auxiliary problem with the final payoff at an exponential terminal time. Second, we transform the problem with regime-switching into an equivalent local optimization problem with a final payoff up to the first regime switching time. The refraction-reflection strategy with regime-modulated thresholds can be shown as optimal by using results in the first step and some fixed point arguments for auxiliary recursive iterations.

D. Croydon (京大数理研) Scaling limits of random walks on random graphs in critical regimes

David Croydon (Kyoto Univ.) Scaling limits of random walks on random graphs in critical regimes

概要 In describing properties of disordered media, physicists have long been interested in the behaviour of random walks on random graphs that arise in statistical mechanics, such as percolation clusters and various models of random trees. Random walks on random graphs are also of interest to computer scientists in studies of complex networks. In 'critical' regimes, many of the canonical models exhibit large-scale fractal behaviour, which mean it is often a challenge to describe their geometric properties, let alone the associated random walks. However, in recent years, the deep connections between electrical networks and stochastic processes have been advanced so that tackling some of the key examples of random walks on random graphs is now within reach. In this talk, I will introduce some recent work in this direction, and describe some prospects for future developments.

概要 Heath–Jarrow–Morton model is the most general model of interest rate in mathematical finance. Musicla (1993) derived that this model reduces to a stochastic partial differential equations (SPDE). This SPDE is called by Heath–Jarrow–Morton–Musicla (HJMM) equation. In this talk, we consider the existence and uniqueness of the solution of HJMM equation driven by Lévy noise. Kusuoka (2000) showed the existence and uniqueness of weak solution of this equation under the boundary condition in the case of Wiener process. We extend this approach to Lévy Process.

22 濵口雄史(京 大 理) Flow of forward-backward stochastic differential equations · · · · · · · · 15
Yushi Hamaguchi (Kyoto Univ.) Flow of forward-backward stochastic differential equations

概要 Motivated from time-inconsistent stochastic control problems, we introduce a new type of coupled forward-backward stochastic systems, namely, flows of forward-backward stochastic differential equations. They are systems consisting of a single forward stochastic differential equation (SDE) and a continuum of backward SDEs (BSDEs), which are defined on different time intervals and connected via an equilibrium condition. We formulate a notion of equilibrium solutions in a general framework and discuss the well-posedness of the equations.

89 統計数学

概要 An explicit martingale representation for random variables described as a functional of a Lévy process will be given. The Clark—Ocone theorem shows that integrands appeared in a martingale representation are given by conditional expectations of Malliavin derivatives. Our goal is to extend it to random variables which are not Malliavin differentiable. To this end, we make use of Itô's formula, instead of Malliavin calculus. As an application to mathematical finance, we shall give an explicit representation of locally risk-minimizing strategy of digital options for exponential Lévy models. Since the payoff of digital options is described by an indicator function, we also discuss the Malliavin differentiability of indicator functions with respect to Lévy processes.

Masayuki Kageyama Bayesian Markov decision processes (Nagoya City Univ./Tsinghua Univ.)

概要 The Laplace spectral density kernels are a new type of spectral density, which characterize the collection of all marginal bivariate distribution in a given stationary time series, in the absence of moment assumptions. In this talk, we consider a Kolmogorov-Smirnov (KS) test for Laplace spectral density kernels. This test, thus, is a goodness-of-fit test for the collection of all bivariate marginals of an observed series. First, we derive the asymptotic null distribution of the KS statistic which, however, is not distribution-free. We therefore propose a numerical method, combined with the estimation of a covariance kernel, for the computation of critical values. Finally, we show that our testing procedure is consistent.

			sion models with long-memory disturbances · · · · · · · · 10
	Yujie Xue	(Waseda Univ.)	Modified LASSO estimators for high-dimensional linear quantile regression models with long-memory disturbances

概要 It is the fundamental task of statistics to find out internal relationship of diversity of scientific observations. Quantile regression offers the opportunity for a more complete view of the relationships among stochastic variables. In this talk, the asymptotic properties of modified LASSO estimators for linear quantile regression models are developed, when the disturbances are long-memory which implies the dependence on the disturbances before decays very slowly, and when the dimension of regressor p varies with respect to the observation length n. Especially, when p increases as n increases, it corresponds to a high-dimensional case.

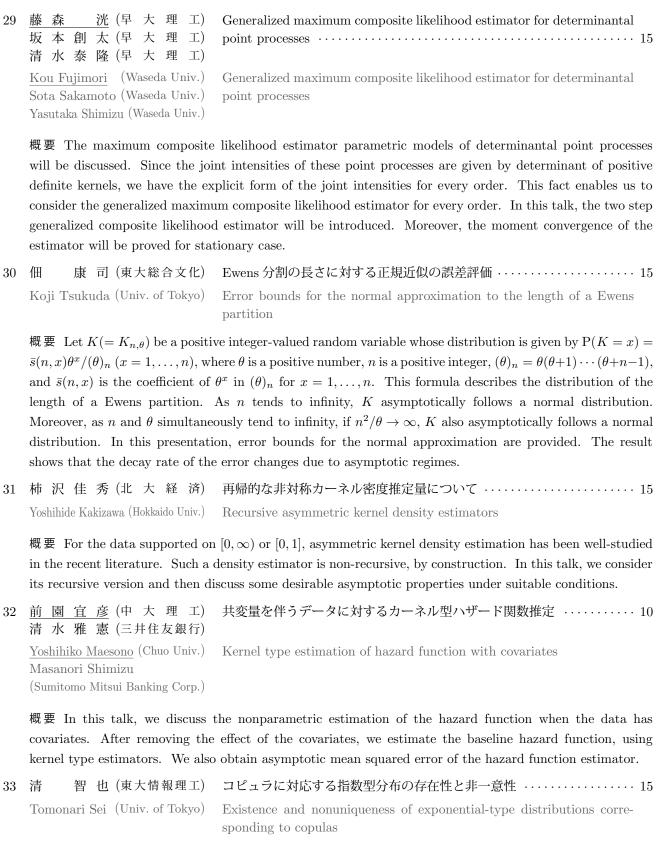

27 木 村 晃 敏 (早 大 理 工)	The asymptotic properties of the correlation estimator between latent
	processes · · · · · · 15
Akitoshi Kimura (Waseda Univ.)	The asymptotic properties of the correlation estimator between latent
	processes

概要 In this talk, we treat a model in which the finite variation part of a two-dimensional semi-martingale is expressed by time-integration of latent processes. We propose a correlation estimator between the latent processes and show its consistency and asymptotic mixed normality. Moreover, we propose two types of estimators for asymptotic variance of the correlation estimator and show their consistency in a high frequency setting. Our model includes doubly stochastic Poisson processes whose intensity processes are correlated Itô processes.

	Yusuke Kaino (Osaka Univ.)	Quasi-likelihood analysis for noisily observed diffusion processes
	Masayuki Uchida (Osaka Univ.)	

概要 We study the polynomial-type large deviation inequalities for quasi-likelihood functions for discretely and noisily observed diffusion processes by applying the results in Yoshida (2011, AISM). The inequalities lead to the mathematical validity of the adaptive Bayes-type estimators with the same asymptotic distributions as adaptive maximum-likelihood-type estimators in Nakakita and Uchida (2019, SJS). Furthermore, it is shown that both the adaptive maximum-likelihood-type estimators and the adaptive Bayes-type estimators have the convergence of moments. We also examine the behaviours of adaptive Bayes-type estimators in computational simulation, and check that their performance is indeed equivalent to that of the adaptive maximum-likelihood-type estimators.

概要 The space of probability density functions on the Euclidean space is decomposed into orbits with respect to coordinate-wise transformations. By Sklar's theorem, each orbit has a unique copula density. In this research, we consider a problem of whether similar results hold for exponential-type distributions instead of copulas. It is shown that, under regularity conditions, the existence holds whereas the uniqueness fails.

概要 Consider discrete multivariate probability models where some parameters from the first sample and those from the second sample are proportional. In two sample problems under the the null hypothesis where the samples are from the same population is tested against the hypothesis where the samples are from the different population. It is found that the total information is equal to the sum of the within information and the between information in some case, but not equal in several cases. To investigate this phenomenon, we found some interesting results. Relationships between the above problems and the Fisher Information are also discussed.

概要 We consider AIC for selecting the degree in a growth curve model when the data set has a three-step monotone missing pattern. Throughout this talk, we assume that the data are missing completely at random (MCAR). In this talk, we prove that the AIC is an exact unbiased estimator of the AIC-type risk function defined by the expected log-predictive likelihood when the maximum likelihood estimator of unknown mean parameter vector with known covariance matrix is used.

概要 Bartlett-Nanda-Pillai test is one of the famous test for the linear hypothesis about the regression coefficients of the multivariate linear model. Under normality assumption, the null distribution function can be represented as an integral of a matrix beta function on some region. Using Laplace's approximation method for integrals, an asymptotic expansion formula of the null distribution function is derived under a large sample and high dimensional asymptotic framework. An error bound for the derived approximation formula is also derived.

14:15~14:55

概要 In this talk, we consider a two-sample test for high-dimensional data. Aoshima and Yata (2018, Sinica) proposed two eigenvalue models for high-dimensional data. One is called strongly spiked eigenvalue (SSE) model and the other one is called non-SSE (NSSE) model. Ishii (2017, HMJ) considered uni-SSE (USSE) and gave a two-sample test procedure by using the noise-reduction method given by Yata and Aoshima (2012, JMVA). However, Ishii (2017, HMJ) assumed the equality of the first eigenspaces. In this talk, we give a new test procedure without assuming the condition. We also give numerical results of our new test procedure and data analysis by using microarray data sets.

<u>Kazuyoshi Yata</u> (Univ. of Tsukuba) Geometric consistency for high-dimensional mixture data Makoto Aoshima (Univ. of Tsukuba)

概要 In this talk, we consider clustering based on principal component analysis (PCA) for high-dimensional mixture data. First, we derive a geometric representation of high-dimension, low-sample-size (HDLSS) data taken from a mixture model. With the help of the geometric representation, we give geometric consistency properties of sample principal component scores in the HDLSS context. We show that PCA can cluster HDLSS data under certain conditions in a surprisingly explicit way. Finally, we demonstrate the performance of the clustering by using gene expression data sets.

Xiaoling Dou Baker's distribution, Bernstein copula and B-spline copulas (早大データ科学総合研究教育センター)

Xiaoling Dou (Waseda Univ.) Baker's distribution, Bernstein copula and B-spline copulas

概要 A method that uses order statistics to construct multivariate distributions with fixed marginals is proposed by Baker (2008). We investigate the properties of Baker's bivariate distributions. The properties include the weak convergence to the Fréchet-Hoeffding upper bound, the product-moment convergence and the totally positivity of order 2. As Baker's distribution utilizes a representation of the Bernstein copula in terms of a finite mixture distribution, we propose expectation-maximization (EM) algorithms to estimate the Bernstein copula and give illustrative examples using real data sets and a 3-dimensional simulated data set. These studies show that the Bernstein copula is able to represent various distributions flexibly and that the proposed EM algorithms work well for such data.

Using B-spline functions, we construct a new class of copulas, B-spline copulas, that includes the Bernstein copulas as a special case. The range of correlation of the B-spline copulas is examined, and the Fréchet–Hoeffding upper bound is proved to be attained when the number of B-spline functions goes to infinity. As the B-spline functions are well-known to be an order-complete weak Tchebycheff system, we show that the property of total positivity of any order (TP_{∞}) follows for the maximum correlation case. These results extend the classical results for the Bernstein copulas. In addition, we derive in terms of the Stirling numbers of the second kind an explicit formula for the moments of the related B-spline functions on $[0, \infty)$.

On acquisition of 3-dimensional information from the projection images

概要 In the fields of engineering and medicine, three-dimensional tissue (structure) is needed to be analyzed. There are CT and MRI equipment to analyze three-dimensional tissue, but they are expensive and have limited spatial resolution. On the other hand, although optical projection images such as a microscope are relatively inexpensive and have high spatial resolution, it is very difficult to reconstruct three-dimensional structure from the obtained image. In this talk, we treat structure of silicon gel and chromatin in the cell nucleus as an example. Using the topological information from the projection image of them, we acquire and analyze the three-dimensional information required for practical use. If this method can be arranged mathematically, we will be able to discover many applications in the future.

概要 When we consider a deformation of point cloud data, the deformation can be formalized as a sampled map, which is a finite subset of an underlying continuous map. In this talk, we provide a new construction of persistent homology for sampled maps, which can capture the homology induced map of the underlying map. The key idea is block matrix form of persistence modules on commutative ladders, and the functoriality of (1:3, 1:3) submatrices ensures the well-definedness of the persistent homology. Moreover, the functoriality can be generalized for arbitrary length and arbitrary diagonal submatrices, and enables to analyze 2-dimensional persistent homology.

A method for removeing extra solutions in an integer-type algorithm for solving higher-order linear ODEs with general algebraic coefficient functions

概要 A kind of generalization was proposed by the author for an integer-type algorithm for solving higher-order linear ODEs, which was proposed by the author and M. Hayashi several years ago, by means of algebraic extensions of the field of rational functions. By this generalization, for example, we can solve the higher-order linear ODEs whose coefficient functions are general algebraic functions, by means only of four arithmetical operations among integers. However, this generalization may cause extra solutions, because this generalization increases the orders of the ODEs. In this study, the author proposes a general method for removing these extra-solution components effectively from numerical results. Moreover, some successful numerical examples are given for the Schrodinger equations whose potential functions belong to the simple extension of the field of rational functions.

概要 We present an error analysis of piecewise linear nonconforming Crouzeix—Raviart finite element method (CR FEM) for the Poisson problem in 3dim without the shape regularity condition. First, we show that in this case, Crouzeix—Raviart finite element method is equivalent to the lowest order Raviart—Thomas finite element method (RT FEM). Next, using the Babuška—Aziz technique, we present error estimates of RT interpolation. Since RT FEM is confirming, a Céa type lemma is valid and error estimates of RT FEM are obtained from that of RT interpolation. Using the obtained equivalence of CR and RT FEMs, we finally present the targeted error estimates of CR FEM. We again emphasise that we do not impose the shape-regular condition for the mesh partition.

概要 For simulations of various problems, we need to consider complex boundary conditions. For example, boundary conditions involving a Laplace—Beltrami operator, such as a dynamic boundary condition and a generalized Robin condition play important roles for application to reduced-FSI model and Cahn—Hilliard equations. There are several works for error estimates of discontinuous Galerkin methods for a dynamic boundary condition and a generalized Robin condition. However, that study considers only a rectangle domain, so it is difficult to apply it to practical problems. In this study, we show the analysis and some numerical results of a discontinuous Galerkin method for Poisson equations with a generalized Robin boundary condition in a smooth domain.

- 田中健一郎 (東大情報理工) 解析関数に対する最良近似の評価および数理最適化による近似公式の構築 Ken'ichiro Tanaka (Univ. of Tokyo) Estimate of the best approximation of analytic functions and construction of approximation formulas for them by mathematical optimization
- 概要 This talk is concerned with approximation theory of analytic functions with prescribed decay on a strip region including the real axis. Such functions appear when we use numerical methods with variable transformations. Typical examples of such methods are provided by double-exponential (DE) sinc formulas for function approximation and DE formulas for numerical integration. They are based on variable transformations yielding double-exponential decay of functions on the real axis, which improves the accuracy of the approximation of functions or their integrals. It has been known that the formulas are nearly optimal on Hardy spaces with a double-exponential weight on the strip region, which are regarded as spaces of transformed functions by the variable transformations. However, optimal formulas have not been known explicitly so far. Then, we consider approximation theory of analytic functions in weighted Hardy spaces for a general weight on the strip region. More precisely, our objectives are (i) precise estimate of the best approximation of functions and their integrals in the space and (ii) finding general procedure to construct accurate approximation formulas based on the estimate. In particular, the first objective includes estimating an analogue of the linear n-width of the unit ball in the weighted Hardy space. We show some results about the first objective. Furthermore, with a view to the second objective, we have recently proposed a simple method for obtaining sampling points for approximating functions and numerical integration. This method is based on a convex minimization problem of a discrete energy. By solving the problem with a standard optimization technique, we obtain sampling points that realize accurate formulas for approximating functions and numerical integration. We also provide theoretical convergence analyses of the formulas via a duality theorem of the continuous counterpart of the minimization problem.

概要 The contents of three analytic methods, namely, analysis of periodic solutions in non-autonomous system, equilibrium points in autonomous system, and periodic solutions in autonomous system, are virtually identical. These individual method have been intended utilizing a new perspective algorithm for individual analytic method. Three individual programs are forming an unified program. The unified program has been made improving easy to grasp source code and to modify source code.

概要 We present a class of distributed delay differential equations that has periodic solutions of period 2, where the maximum delay of the equation is 1. The existence of the periodic solutions is proven, following the idea by Kaplan and Yorke (1974): an ansatz deduces a second order ordinary differential equation. We show that, for some special equations, there exist periodic solutions that can be expressed in terms of the Jacobi elliptic functions explicitly.

Isamu Ohnishi (Hiroshima Univ.) The application to heterocist cell differenciation of a terrestrial cyanobacteria of Nostochineae of microscopically fine structure theorem of the most stable stationary state in Turing patterns

概要 Report that the simple but robust mathematical principle of so-called "Turing instability" is important also here as a design manner, which can be a useful principle to understand a part of the rationality of a kind of life creature's activities in post-transcrition-translation process since Professor Alan Turing wrote his very famous paper. Terrestrial cyanobacteria of Nostochineae, while unicellular, makes a group of population, adapts to the environment and makes various efforts to survive. For example, when performing Biological Nitrogen Fixation (BNF), some of them will make differentiation into "heterocysts" cells, if nitrogen compounds feel poor in themselves. These are cells specialized for the above BNF, wherein cyanobacteria protects nitrogenase, which is an enzyme protein of the above reaction, from oxygen. They make BNF in those cells, as pattern formation is accompanied. We have a fundamental interest of its mathematical mechanism.

概要 The Leaky Integrate and Fire (LIF) model is widely used to describe the dynamics of neural networks. We can derive the Fokker-Planck equation from the LIF model after a diffusive approximation of the mean-field limit of a stochastic differential equation system. In this talk, we show that the Fokker-Planck equation generates a spatially nonconstant solution with a time-periodical motion induced by a delay in the effect of the total activity on the neurons.

Spreading profile of solutions for a free boundary problem of a reaction diffusion equation with a multi-stable nonlinearity

概要 In this talk, I will treat propagation phenomena in a free boundary problem of reaction diffusion equation of the form: $u_t = u_{xx} + f(u)$ (t > 0, 0 < x < h(t)) where h(t) is the unknown moving boundary (free boundary) which is determined by the Stefan condition of the form $h'(t) = -\mu u_x(t, h(t))$. In the work of Du and Lin (2010), this type of problem was introduced as a model which describes the spreading of new or invasive species. From this work, propagating phenomena in the free boundary problems attract more and more attention of mathematicians. Among the various studies on the free boundary problems, recent work of Du, Matsuzawa and Zhou (2014) showed that the profile of any spreading solution (which corresponds to the success of invasion) approaches a traveling wave solution associated with the free boundary problem, which was introduced by Du and Lou (2015) and is called semi-wave.

In this talk, I will give some recent study on propagation profiles of solutions for the free boundary problem of reaction-diffusion equation with some class of multi-stable nonlinearity. In particular, under certain condition, the profile of the spreading solution approaches a so-called *propagating terrace*. I will also present a result about radially symmetric solutions in high space dimensions.

This talk is based on some joint works with Dr. Yuki Kaneko (Japan Women's University) and Professor Yoshio Yamada (Waseda University).

概要 We propose a quantum walk defined by digraphs (mixed graphs). This is essentially a special case of twisted Szegedy walks, and is equipped with a 1-form function defined by digraphs. The discriminant of this quantum walk is a matrix that is a certain normalization of generalized Hermitian adjacency matrices. Furthermore, we give definitions of the positive and negative supports of the transfer matrix, and clarify explicit formulas of their supports of the square. In addition, we give a consideration by computer on the identification of digraphs by their eigenvalues.

概要 Quantum walks have been intensively studied as quantum versions of classical random walks. The time evolution of the quantum walk is defined by a unitary operator, which is expressed as a product of coin and shift operators. In this study, we analyze a one-defected quantum walk on the multi-dimensional lattice by using the quantum walk version of spectral mapping theorem. We get some different results from the previous study by Fuda et al.

松 本 直 己 (慶 大 D M C) グラフ上の組合せゲーム 45

Naoki Matsumoto (Keio Univ.) Combinatorial games on graphs

概要 A combinatorial game is a two-player game with perfect information (i.e., no hidden information), no chance moves (i.e., no probabilistic matter) and outcome restricted to (lose, win) and (draw, draw) for the two players who move alternately. Combinatorial games include well-known games such as Chess, Checkers, Go, and also include an elementary puzzles and games (enjoyed by children) such as Sudoku, tic-tac-toe and Geography. So far, a lot of combinatorial games are introduced and analyzed, and then lots of them are also considered on graphs as one of generalizations of those games. On the other hand, many mathematicians created combinatorial games on graphs which are deeply related to typical graph invariants. Thus, in this talk, we first briefly classify combinatorial games on graphs and introduce typical combinatorial games on graphs. Moreover, we also provide open problems on those games.

上 原 隆 平 (北 陸 先 端 大) ゲームとパズルと計算量 · · · · · · · 60

Ryuhei Uehara (JAIST) Games, puzzles, and complexity

概要 A computation consists of algorithm, which is a sequence of basic operations. When you consider an algorithm, you assume some computation model that has "usual" arithmetic operations. On the other hand, when you enjoy a puzzle, you have to find an algorithm by combining reasonable basic operations to its goal. From the viewpoint of theoretical computer science, puzzles give us some insight to computation and computational complexity classes in various way.

Some puzzles and games give reasonable characterizations to computational complexity classes. For example, "pebble game" is a classic model that gives some complexity classes in a natural way, and "constraint logic" is recent model that succeeds to solve a long standing open problem due to Martin Gardner that asks the computational complexity of sliding block puzzles. Such puzzles gives us "typical" and characterization and "intuitive" understanding for some computational complexity classes.

On the other hand, there are some puzzles and games that give nontrivial interesting aspects of computational complexity classes. For example, let us consider "14-15 puzzle" which is classic well known sliding puzzle. By parity, we can determine if one arrangement can be slid to the other in linear time. Moreover, we can always find a way for sliding between them in quadratic time. However, interestingly, finding the optimal solution is NP-complete in general. Through such classic puzzles, the reconfiguration problems are recently well investigated as a new framework of characterization of computational complexity classes. I give some recent results for these games and puzzles on graphs from the viewpoint of theoretical computer science.

伊藤大雄(電通大情報理工) 一般化じゃんけん —無駄手, 面白さ, 異手間引分など— ・・・・・・・・・ 60 Hiro Ito (Univ. of Electro-Comm.) Generalized janken —Useless signs, measure of amusement, ties between different signs, etc.—

概要 We present research on generalized janken. Janken is a very simple and well-known game in Japan. It is originated in China, and many variants are seen throughout the world. A variant of janken can be represented by an asymmetric digraph, where a vertex corresponds to a sign and an arc (x, y) indicates that sign x defeats sign y. However, not all asymmetric digraphs define useful janken variants, i.e., some janken variants may include a useless sign, which is strictly inferior to another sign in any case. We show research on janken variants in terms of useless signs, a measure of amusement, and ties between different signs.

The spectrum of the non-unitary quamtum walk, Part 1 — Mochizuki Keisuke Asahara (Hokkaido Univ.) Kim Obuse model— Yohei Tanaka (Flinders Univ.) Akito Suzuki (Shinshu Univ.)

概要 We consider the spectrum of a 1-dimensional 2-state non-unitary quantum walk which is defined by Mochizuki, Kim and Obuse. This time-evolution operator acts on the Hilbert space $\ell^2(\mathbb{Z}; \mathbb{C}^2)$. This model depends on a parameter $\gamma > 0$. The loss and gain of the photon is controlled by γ in this model. If $\gamma = 0$, then the photon energy does not either lose or gain. In particular, the model is a unitary operator in the case of $\gamma = 0$. However, in the case of $\gamma > 0$, the model is not unitary. Moreover, it is not a normal operator. This fact means that we can not use some general theorems of the unitary operator when we analyze some properties of this model. I this talk, we classify the spectrum of the model into three different cases according to the size of γ .

浅 原 啓 輔(北 大 非ユニタリな量子ウォークのスペクトル 2 ―伊原ゼータへの応用― ・・・ 15 船川大 樹(北海学園大工) 瀬川悦生(横浜国大環境情報) 鈴木章斗(信 州大 寺 西 功 哲(北 大 理) Keisuke Asahara (Hokkaido Univ.) 善 本 潔 (日 大 理 工) 辺着色完全 2 部グラフの構造とその応用について · · · · · · · · 15
Kiyoshi Yoshimoto (Nihon Univ.) Structures of edge-colored complete bipartite graphs and the applications
概要 Let G be a graph. A mapping $c: E(G) \to \mathbb{N}$ is called an edge-coloring of G and $c(e)$ is called the color of an edge e . A graph with an edge-coloring map is called an edge-colored graph and denoted by (G,c) . A subgraph H of G is called rainbow if every pair of edges in H have distinct colors and H is said to be properly colored, or shortly PC , if any two adjacent edges have different colors. In this talk, first we will consider structures of edge-colored complete bipartite graphs $(K_{n,m},c)$ without PC cycles of length four, and next the number of disjoint PC cycles in $(K_{n,m},c)$ will be discussed related with Bermond-Thomassen Conjecture. Finally several problems and results around this topic will be given.
斎藤明(日大文理) Chorded cycles in dense graphs · · · · · · 15
Akira Saito (Nihon Univ.) Chorded cycles in dense graphs
概要 A cycle of order k is called a k -cycle. A non-induced cycle is called a chorded cycle. A graph G of order $n \geq 4$ is chorded pancyclic if G contains a chorded k -cycle for every integer k with $4 \leq k \leq n$. Cream, Gould and Hirohata (2017) conjectured that a hamiltonian graph G of order $n \geq 4$ satisfying $ E(G) \geq \frac{1}{4}n^2$ is chorded pancyclic unless G is either $K_{\frac{n}{2},\frac{n}{2}}$ or $K_3 \times K_2$. In this talk, we affirmatively answer this conjecture by showing that if a graph G of order n with $ E(G) \geq \frac{1}{4}n^2$ contains a k -cycle, then G contains a chorded k -cycle, unless $k=4$ and G is either $K_{\frac{n}{2},\frac{n}{2}}$ or $K_3 \times K_2$, Then observing that $K_{\frac{n}{2},\frac{n}{2}}$ and $K_3 \times K_2$ are exceptions only for $k=4$, we further relax the density ondition for sufficiently large k .
大野由美子 (横浜国大環境情報)Locally connected graphs with chromatic and achromatic numbers both松本直己(慶大DMC)3
概要 A proper n -coloring $c:V(G)\to\{1,\ldots,n\}$ of a graph G is a complete n -coloring if every pair of colors appears on at least one edge. The maximum number n such that G has a complete n -coloring is called the achromatic number of G . A graph G is locally connected if the neighbourhood of every vertex of G is connected. In this talk, we shall show that both the chromatic and the achromatic numbers of connected and locally connected graph G are exactly 3 if and only if G is isomorphic to a complete tripartite graph.

概要 For positive integers t and n , a facial t -complete n -coloring of a graph G embedded on a closed surface is a color assignment $c:V(G)\to\{1,\ldots,n\}$ of the vertices such that any t -tuple of colors appears on the

概要 For positive integers t and n, a facial t-complete n-coloring of a graph G embedded on a closed surface is a color assignment $c: V(G) \to \{1, \ldots, n\}$ of the vertices such that any t-tuple of colors appears on the boundary of some face of G. The facial t-achromatic number of G, denoted by $\psi_t(G)$, is the maximum number n such that G has a facial t-complete n-coloring. The facial t-achromatic number depends on the embedding of G in genetral. That is, for another embedding f(G) of G, $\psi_t(f(G))$ may not be equal to $\psi_t(G)$. In this talk, we evaluate the difference between $\psi_3(G)$ of a triangulation G on a closed surface and $\psi_3(f(G))$ of another triangulation of G.

<u>Yusuke Suzuki</u> (Niigata Univ.) Non-1-planarity of lexicographic products of graphs Naoki Matsumoto (Keio Univ.)

概要 In this talk, we show the non-1-planarity of the lexicographic product of a theta graph and K_2 . This result completes the proof of the conjecture that a graph $G \circ K_2$ is 1-planar if and only if G has no edge belonging to two cycles.

Hidefumi Ohsugi

Two enriched poset polytopes

(Kwansei Gakuin Univ.) Akiyoshi Tsuchiya (Univ. of Tokyo)

概要 In 1986, Stanley introduced two classes of lattice polytopes associated to finite partially ordered sets, which are called order polytopes and chain polytopes. It is known that the Ehrhart polynomials of these polytopes coincide with some counting polynomials of P-partitions. In this talk, from the theory of (left) enriched P-partitions, which are introduced and studied by Stembridge and Petersen, we introduce enriched order polytopes and enriched chain polytopes. In particular, we show that the Ehrhart polynomials of these polytopes coincide with some counting functions of left enriched P-partitions.

56 <u>篠 原 雅 史</u> (滋 賀 大 教 育) Maximal 2-distance sets containing a regular simplex · · · · · · · · · · 15 野 崎 寛 (愛 知 教 育 大)

<u>Masashi Shinohara</u> (Shiga Univ.) Maximal 2-distance sets containing a regular simplex Hiroshi Nozaki (Aichi Univ. of Edu.)

概要 A finite subset X of the Euclidean space is called an s-distance set if the number of the distances of two distinct vectors in X is equal to s. An s-distance set X is said to be maximal if any vector cannot be added to X while maintaining s-distance. We investigate a necessary and sufficient condition for vectors to be added to the regular simplex such that the set has only 2 distances. We construct several maximal 2-distance sets that contain the regular simplex.

16:40~17:40 特別講演

野 﨑 寛(愛知教育大) 正則一様ハイパーグラフにおける線形計画限界について

Hiroshi Nozaki (Aichi Univ. of Edu.) Linear programming bounds for regular uniform hypergraphs

概要 Delsarte (1973) gave the linear programming method to find bounds for the cardinality of codes with given distances. Delsarte's method is useful to solve some optimization problems of maximizing the cardinality of a code in the Euclidean sphere or certain special association schemes, like Johnson schemes or Hamming schemes. A particular example of applications of the bound is the determination of the kissing number for a sphere. In this talk, we introduce an analogous theory of Delsarte's method for regular graphs. This method gives bounds for the order of a regular graph with given eigenvalues. The optimal graphs for this bound are distance-regular graphs with high girth, like Moore graphs. We also introduce recent results on a generalization of this bound for regular uniform hypergraphs.

- 4 村上 順(早大理工) Quantized SL(2) representations of knot groups · · · · · · · · · · 15

 Jun Murakami (Waseda Univ.) Quantized SL(2) representations of knot groups
 - 概要 Let A be a braided Hopf algebra A with braided commutativity. We introduce the space of A representations of a knot K by generalizing the G representation space of K defined for a group G. By rebuilding the G representation space from the view point of Hopf algebras, it is extended to any braided Hopf algebra with braided commutativity. Applying this theory to BSL(2) which is the braided quantum SL(2) introduced by S. Majid, we get the space of BSL(2) representations, which is a non-commutative algebraic scheme which provides quantized SL(2) representations of K. This is a joint work with Roland van der Veen.

概要 A combed 3-manifold is a pair of a closed oriented 3-manifold M and a homotopy class of non-singular vector fields on M. Viewing combed 3-manifolds from virtual knot diagrams, we introduce an invariant of 3-manifolds.

6 大山淑之 (東京女大現代教養) Virtualization and n-writhes for virtual knots … 10 櫻井みぎ和 (芝浦エ大工) Yoshiyuki Ohyama Virtualization and n-writhes for virtual knots (Tokyo Woman's Christian Univ.) Migiwa Sakurai (Shibaura Inst. of Tech.)

概要 Satoh and Taniguchi introduced the n-writhe J_n for each non-zero integer n, which is an invariant for virtual knots. They give a necessary and sufficient condition for a sequence of integers to be that of the n-writhes of a virtual knot. It is obvious that the virtualization of a real crossing is an unknotting operation for virtual knots. The unknotting number by a virtualization is called a virtual unknotting number and denoted by $u^v(K)$. We have shown that for any given non-zero integer n and N, there exists a virtual knot K with $u^v(K) = 1$ and $J_n(K) = N$ in a previous paper. In this talk, we show that if $\{c_n\}_{n\neq 0}$ is a sequence of integers with $\sum_{n\neq 0} nc_n(K) = 0$, then there exists a virtual knot K with $u^v(K) = 1$ and $J_n(K) = c_n$ for any $n \neq 0$. It is an extension of the previous result, and is a more powerful result.

7	金 信 泰 造 (阪 市 大 理) 滝 岡 英 雄 (神 戸 大 理)	結び目の 4 移動距離 · · · · · · · 10
	Taizo Kanenobu (Osaka City Univ.)	4-move distance of knots
	Hideo Takioka (Kobe Univ.)	

概要 4-move is a local change for knots which changes 4 half twists to 0 half twists or vice versa. In 1979, Yasutaka Nakanishi conjectured that 4-move is an unknotting operation. This is still an open problem. In this talk, we consider 4-move distance of knots, which is the minimal number of 4-moves needed to deform one into the other. In particular, the 4-move unknotting number of a knot is the 4-move distance to the trivial knot. We give a lower bound of the 4-move unknotting number and a table of the 4-move unknotting number of knots with up to 9 crossings. This is a joint work with Taizo Kanenobu.

概要 In this talk, Y. Nozaki, K. Sato and I introduce a new family of invariants of homology 3-spheres. These invariants are defined by using some filtered version of instanton Floer homology. Moreover, we show important properties of the invariants which give a family of subgroups of the homology cobordism group parametrized non-negative real numbers. In this point of view, we give a reproof of the result of Furuta and Fintushel—Stern and its generalization.

概要 Y. Nozaki, M. Taniguchi and the speaker introduced new homology cobordism invariants $\{r_s\}_{s\in[-\infty,0]}$ of homology 3-spheres. In particular, for any sequence of homology 3-spheres $\{Y_n\}_{n=1}^{\infty}$, if (1) Y_1 has a non-trivial r_s , (2) $-Y_1$ has trivial r_s , and (3) there exists a simply connected negative definite cobordism with boundary $Y_n \coprod -Y_{n+1}$ for each n, then we can conclude the Y_n are linearly independent in the homology cobordism group. As an application, we give a sufficient condition for the linear independence of all positive 1/n-surgeries on a knot in S^3 . As another application, we prove that the Whitehead doubles of all (2,q)-torus knots with odd $q \geq 3$ are linearly independent in the knot concordance group.

概要 K. Sato, M. Taniguchi and I constructed a homology cobordism invariant of integral homology 3-spheres to study the homology cobordism group. The invariant was computed only for some Brieskorn manifolds. In this talk, we compute the invariant of a certain hyperbolic 3-manifold and the resulting value seems to be irrational.

11 <u>北 野 晃 朗</u> (創 価 大 理 工) Finiteness of the image of the Reidemeister torsion of a splice · · · · · · · 10 野 崎 雄 太 (明大研究・知財)

Teruaki Kitano Yuta Nozaki (Meiji Univ.) Finiteness of the image of the Reidemeister torsion of a splice Yuta Nozaki (Meiji Univ.)

概要 We consider the Reidemeister torsion of a 3-manifold M for $SL(2, \mathbb{C})$ -representations as a \mathbb{C} -valued function on the character variety of M and the image $RT(M) \subset \mathbb{C}$ of this function. We prove that RT(M) is a finite set if M is the splice of two certain knots in S^3 . The proof is based on an observation on the character varieties and A-polynomials of knots. This is a joint work with Yuta Nozaki.

14:15~15:15 特別講演

Tamás Kálmán (Tokyo Tech) The Homfly polynomial, Floer homology, and combinatorics

概要 All oriented links L have special diagrams. Based on such a diagram we construct a sutured handlebody M which is closely related to the branched double cover of the link. From the sutured Floer homology of M we recover the Alexander polynomial Δ of L via a simple forgetful map. More surprisingly, in cases when the diagram is also positive (so that L is a special alternating link), SFH(M) can be used to compute those coefficients of the Homfly polynomial of L whose sum is the leading coefficient of Δ . To extract this information algebraically, we need the notion of the interior polynomial of a bipartite graph. Geometrically, this entails the cutting of some handles of M and identifying the resulting handlebody with a Seifert surface complement for another special alternating link. The talk involves joint results with Λ . Juhász, Π . Murakami, Π . Postnikov, Π . Rasmussen, and Π . Thurston.

Ken'ichi Yoshida (Saitama Univ.) An example of degeneration of 3-dimensional hyperbolic cone structures with decreasing cone angles

概要 For deformation of 3-dimensional hyperbolic cone structures about cone angles θ , the local rigidity is known for $0 \le \theta \le 2\pi$, but the global rigidity is known only for $0 \le \theta \le \pi$. The proof of the global rigidity by Kojima is based on the fact that hyperbolic cone structures do not degenerate in deformation with decreasing cone angles. In this talk, we will construct hyperbolic cone structures on a link in $T^2 \times I$ explicitly. Then we will obtain an example of degeneration of hyperbolic cone structures with decreasing cone angles $\pi < \theta < 2\pi$.

概要 Hitchin components are prefered connected components of $\operatorname{PSL}_n\mathbb{R}$ -character varieties of surface groups, which are higher dimensional analogs of Teichmüller spaces. By definition, they contain a subset corresponding to Teichmüller spaces, which is called the Fuchsian locus. In this talk, we show that the Fuchsian locus of Hitchin components corresponds to certain affine slice of the interior of a convex polytope under the Bonahon–Dreyer parameterization.

Masaki Tsukamoto (Kyushu Univ.) Mean dimension of dynamical systems and information theory

- 概要 In the late 1950's Kolmogorov discovered that Shannon's entropy can be used in ergodic theory. This is a revolutionary idea, and ever since there have been rich interactions between information theory and the study of dynamical systems. Recently we have added some new items in these interactions. A new development comes from mean dimension theory. Mean dimension is a topological invariant of dynamical systems which estimates the number of parameters per iterate for describing the orbits of dynamical systems. We have found that this dynamical invariant has the following two connections with information theory:
- (1) Mean dimension turns out to be a crucial parameter when we try to encode dynamical systems into band-limited signals, say signals of telephone line. This is reminiscent of Shannon's fundamental work on communications over band-limited channels. This discovery was used to solve a problem posed by Lindenstrauss in 1999.
- (2) Mean dimension theory is (in some sense) a topological version of rate distortion theory. Rate distortion theory is a branch of information theory describing a lossy data compression method achieving some distortion constraint. We study the minimax problem about the "rate distortion dimension" and shows that the minimax value is given by mean dimension at least for minimal dynamical systems. This is a mean dimensional analogue of variational principle known for dynamical entropy.

概要 According to K. T. Chen's theory, we can obtain an isomorphisms between the Malcev Lie algebra of a manifold and a certain Lie algebra. We shall consider the space of such an isomorphims and its cohomology. The space can be regarded as a classifying space of a certain automorphism group of the fundamental group,

and its cohomology gives characteristic classes of a fiber bundle.

24 栗 林 勝 彦 (信 州 大 理) ディフェオロジーに付随する単体的微分代数と de Rham の定理 · · · · · · 15 Katsuhiko Kuribayashi (Shinshu Univ.) On the de Rham theorem and simplicial cochain algebras for diffeological spaces

概要 Diffeological spaces have been introduced by Souriau in the early 1980s. The notion generalizes that of a manifold. More precisely, the category Mfd of finite dimensional manifolds embeds into Diff the category of diffeological spaces, which is complete, cocomplete and cartesian closed. As an advantage, we can very naturally define a function space of manifolds in Diff so that the evaluation map is smooth without arguments on infinite dimensional manifolds. We introduce a de Rham complex endowed with an integration map into the singular cochain complex which gives the de Rham theorem for every diffeological space.

概要 We give a spectral sequence converging to the space of knots in an oriented, simply connected closed manifold of dimension greater than 3. This spectral sequence has a computable E2-term. Construction of it is based on Goodwillie's embedding calculus which approximates an embedding space of codimension greater than 2 by a homotopy limit of configuration spaces.

辻 俊輔 (京 大 数 理 研) スケイン代数を用いた 3 次元ホモロジーシリンダーのジョンソン準同型の計算

Shunsuke Tsuji (Kyoto Univ.) A method to compute the Johnson homomorphism on a homology 3-cylinder using a skein algebra

概要 Let Σ be a compact connected oriented surface with nonempty boundary. We consider a homology cylinder (C,c) of Σ where C is a compact connected 3-manifold and $c:\partial(\Sigma\times[0.1])\to\partial C$ is a diffeomorphism such that $c_1:\Sigma\to C, x\mapsto c(x,1)$ and $c_0:\Sigma\to C, x\mapsto c(x,0)$ induce the same isomorphism in their homology groups. For i=0,1, the embedding c_i induces the isomorphism $c_{i*}:\widehat{\mathbb{Q}\pi_1}(\Sigma\times\{i\},(*,i))\to\widehat{\mathbb{Q}\pi_1}(C,(*,i))$ where $*\in\partial\Sigma$. Here, for a manifold M and a base point P, we denote $\widehat{\mathbb{Q}\pi_1}(M,P)=\lim_{n\to\infty}\mathbb{Q}\pi_1(M,P)/(\ker\epsilon)^n$ where ϵ is the augmentation map $\mathbb{Q}\pi_1(M,P)\to\mathbb{Q}, r\in\pi_1(M,P)\mapsto 1$. For an embedding from a handlebody H_g of genus g into $\Sigma\times[0,1]$ and an element ξ of the Torelli group of ∂H_g , we denote by $\Sigma\times[0,1]_{(e,\xi)}$ the 3-manifold H_g and the closure of $\Sigma\times[0,1]\setminus e(H_g)$ glued by $e_{|\partial H_g}\circ\xi$. We remark the pair $(\Sigma\times[0,1]_{(e,\xi)}, \mathrm{id}_{\partial(\Sigma\times[0,1])})$ is a homology cylinder. In this talk, we obtain an invariant for homeomorphic classes of the set consisting of $\Sigma\times[0,1]_{(e,\xi)}$ for any embedding e of a handlebody and any element ξ of the Torelli group of the boundary of the handlebody using some skein algebra. This invariant depends only on the map $c_{1*}c_{0*}^{-1}$. As an application, using this invariant, we give a method to compute the map $c_{1*}c_{0*}^{-1}$.

Norihisa Takahashi (Ritsumeikan Univ.) On presentaions of hyperelliptic periodic diffeomorphisms by Dehn twists Hiraku Nozawa (Ritsumeikan Univ.)

概要 A diffeomorphism of surfaces is called hyperelliptic if it commutes with a hyperelliptic involution. Such diffeomorphisms naturally appear in the study of hyperelliptic curves. On the other hand, periodic diffeomorphisms play an important role in the study of mapping class groups of surfaces. Ishizaka classified up to conjugation hyperelliptic periodic diffeomorphisms of surfaces and gave Dehn twist presentations in terms of Humphries generators. In this talk, we will give an explicit decomposition of surfaces into pentagonal fundamental domains of hyperelliptic periodic diffeomorphisms. We apply it to obtain Dehn twist presentations which are different from those obtained by Ishizaka in general.

概要 A hyperbolic 2-sphere is made from the double of an n-gon in Poincaré disc $(n \ge 3)$. Its geodesic flow is a transitive Anosov flow on a closed 3-manifold. Birkhoff generalized a concept of a section for a flow. We call it Birkhoff section, that is an immersed surface with boundaries. We construct genus one Birkhoff sections for the geodesic flows of hyperbolic 2-spheres with n singularities.

概要 Dimofte, Gukov, Soibelman discovered remarkable identities for quantum dilogarithm functions on a non-commutative algebra as wall-crossing formulas, which are of the form "infinite product = finite product". We derived one of the identities algebraically by using explicit product presentations of the universal R-matrix of the affine quantum group $U_q(\widehat{\mathfrak{sl}_3})$. The presentations were constructed by K. Ito, which correspond to convex orders of positive roots. We calculated explicitly all the root vectors determined by certain convex orders, and obtained two different presentations of the universal R-matrix. Equating them and projecting both sides by a certain good representation yields an "infinite product = finite product" type identity. Specializing it gives the wall-crossing formula proposed by Dimofte et al.

藤 田 遼 (京 大 理) Dynkin 箙に付随する量子アフィン型 Schur-Weyl 双対性

Ryo Fujita (Kyoto Univ.) Quantum affine Schur-Weyl duality associated with a Dynkin quiver

概要 The classical Schur-Weyl duality produces a strong representation-theoretic connection between the complex simple Lie algebra \mathfrak{sl}_n and the symmetric group \mathfrak{S}_d . Its natural quantum affine analogue, called the quantum affine Schur-Weyl duality, is played by their quantum affinizations: the quantum affine algebra $U_q(\widehat{\mathfrak{sl}}_n)$ and the affine Hecke algebra of GL_d . It induces a functor with several good properties between the categories of finite-dimensional modules. Moreover it has a beautiful geometric interpretation via the equivariant K-theory of flag varieties. The main topic of this talk is a further variant of the quantum affine Schur-Weyl duality associated with a Dynkin quiver, which was originally introduced by Kang-Kashiwara-Kim as a special case of their general construction. Here the players are replaced by the quantum affine algebra and the quiver Hecke algebra (also known as Khovanov-Lauda-Rouquier algebra) of the corresponding ADE type. We see that the induced functor enjoys good properties just like the usual case. Also we present its geometric interpretation via the equivariant K-theory of Nakajima's graded quiver varieties.

概要 Cluster algebra is an algebraic structure generated by operations of a quiver called the mutations and their associated simple birational mappings, and it was introduced by Fomin and Zelevinsky in 2000. We present a systematic derivation of tropical (i.e., subtraction-free birational) realization of Weyl groups for various Dynkin diagrams. Our result is related with a class of tropical Weyl groups actions defined on certain rational varieties and also (higher-order) q-Painlevé equations. Key ingredients of the argument are the combinatorial aspects of reflections associated with n-cycles in the quiver. This talk is based on a joint work with Tetsu Masuda and Naoto Okubo.
