Tomoyuki Shirai (Kyushu Univ.) Aspects of determinantal point processes

概要 The importance of determinantal point processes (DPPs) has become widely recognized, within probability theory and diverse application areas, offering both theoretical elegance and practical utility. Their roots trace back to the 1970s when Macchi introduced them as a model for fermions in quantum mechanics. In the late 1990s, driven by the surge of interest in random matrix theory, Soshnikov and Shirai—Takahashi independently extended the framework of DPPs and established the theoretical foundation. Since then, DPPs have seen remarkable growth both in theoretical development and in diverse applications. These applications include studying eigenvalues of certain random matrices, the zeros of certain Gaussian analytic functions, the non-trivial zeros of Riemann zeta function, Poissonized Young diagrams, uniform spanning trees, and even machine learning. In this talk, we provide the background of DPPs, and overview the related topics in DPPs and beyond.

石川剛郎(北 大*) サブリーマン空間の特異曲線とその周辺 · · · · · · · · (13:00~14:00) Goo Ishikawa (Hokkaido Univ.*) Singular curves of sub-Riemannian spaces and related topics

概要 A sub-Riemannian structure is given by a Riemannian metric on a vector subbundle of the tangent bundle (distribution) over a manifold. Then the notion of geodesics or length minimisers are naturally defined on sub-Riemannian spaces. Unlike Riemannian case, there appear abnormal geodesics or singular curves, as sub-Riemannian geodesics, in addition to normal geodesics. It turns out that singular curves are defined, depending just on the distribution, as critical points of end-point mapping in the context of control theory, and they are significant objects also in geometry and topology in their own right. In this talk, several topics and results on singular curves of distributions will be explained for specific cases, say, (2, 3, 4)-distributions (Engel), in terms of the growth of ranks by taking Lie brackets, (2, 3, 5)-distributions (Cartan), (3, 5)-distributions, (4, 5)-distributions, (3, 6)-distributions, (4, 7)-distributions, (8, 15)-distributions and so on, with some perspectives.

川 平 友 規 (一橋大経済) 複素力学系のアナロジー, あるいはアンソロジー (13:00~14:00) Tomoki Kawahira (Hitotsubashi Univ.) Analogies of complex dynamics, or an anthology

概要 I will talk about some analogies between one dimensional complex dynamics (CD1) and other types of analytic dynamical systems. We will begin with classical "Sullivan's dictionary" linking CD1 with Kleinian groups (KG), which later yields the Lyubich-Minsky theory of hyperbolic 3-laminations for CD1. We cannot miss the Bullett-Penrose theory of holomorphic correspondence, and the Hinkkanen-Martin-Sumi theory of (random) rational semigroups which provide fascinating unifications of CD1 and KG. Anti-holomorphic dynamics is often called an "evil twin" of CD1. Complex dynamics in several variables and non-Archimedean dynamics initially developed as analogies to CD1, have recently achieved significant advancements that transcend their original analogical frameworks. With such diversity in the field, we are now at an exciting juncture. The question is: where do we go from here?

Hsueh-Yung Lin (国 立 台 湾 大) On the cone conjectures for Calabi-Yau pairs · · · · · · · · (13:00~14:00)

Hsueh-Yung Lin (Nat. Taiwan Univ.) On the cone conjectures for Calabi-Yau pairs

概要 We will discuss the shapes of various positive cones of divisors of a Calabi-Yau pair, with a special focus on the Kawamata-Morrison-Totaro cone conjectures, as well as the analogous conjecture formulated for the effective cone. We will illustrate some relations between these cone conjectures and some finiteness statements in birational geometry. Along the way, we will also survey some known results related to the cone conjectures. The content of the talk is based on the works by many birational geometers, and partly on joint works with C. Gachet, I. Stenger, and L. Wang.

概要 We discuss how the microlocal analysis methods are applied effectively to the scattering theory. The microlocal analysis was originally developed to investigate very precise singularity properties of solutions to partial differential equations, whereas the scattering theory concerns long time behaviors of solutions to Schrödinger equations or wave equations. Roughly speaking, if we apply the microlocal methods to the equations in the Fourier space, we expect to obtain detailed information on the scattering phenomena. This idea goes back at least to the works by Kitada, Yajima and Isozaki in early 1980's. We introduce very basic concepts of the microlocal analysis and the scattering theory, and we survey some historical developments on the microlocal methods in the scattering theory. Then we review several recent results, including long-range scattering for discrete Schrödinger equations and the microlocal structure of long-range scattering matrices.

清水 泰 隆 (早 大 理 工) 保険数理と Gerber-Shiu 解析: レヴィ・リスク過程に対する スケール関数の推定問題 · · · · · · · (13:00~14:00) Yasutaka Shimizu (Waseda Univ.) Gerber-Shiu analysis in insurance mathematics: estimation of the scale functions for Levy risk processes

概要 In insurance mathematics, the theory of the expected discounted penalty function, known as the "Gerber-Shiu function," introduced by Gerber and Shiu (1998, NAAJ), has evolved into a comprehensive framework that fully embraces classical insurance risk theory. Notably, applying this theory using the spectrally negative Levy process as a model for insurance surplus proves to be an effective tool for analyzing unforeseen risks in finance and insurance, a methodology now commonly referred to as "Gerber-Shiu Analysis." Over two decades have passed since its inception, and the foundational aspects of the theory appear to have been extensively studied. Nonetheless, research from a statistical point of view remains underdeveloped.

The general theory of Gerber-Shiu analysis is discussed under an asset process that follows a spectrally negative Levy process, and it is known that many ruin-related risk quantities can be expressed by using its scale function. Thus, the main statistical issue is estimating the scale functions of Levy processes.

In this talk, we will review the development of Gerber–Shiu analysis and introduce a novel method for statistical estimation of scale functions with its asymptotic theory.

利根川吉廣 (東 工 大 理) 一般化された平均曲率流の存在定理について (13:00~14:00) Yoshihiro Tonegawa (Tokyo Tech) Existence theorems for generalized mean curvature flow

概要 Suppose that we have a moving n-dimensional surface M_t in \mathbb{R}^{n+1} where t is the time variable. If the speed of motion of M_t is equal to the mean curvature of M_t at that point, M_t is said to be a mean curvature flow. Typically, M_t develops some singularity in finite time and there has been numerous attempts to formulate the existence theorem of generalized solution of the mean curvature flow past the singular time. In my talk, I start with some basics such as the definition and the area-decreasing property, and move on to the finer points such as Huisken's monotonicity formula, the tangent flow and the local regularity theorems, and then describe more recent existence theorems for initial value problem with a reasonable coverage of the definition of the generalized solution. These results led us to new insights on the very notion of the mean curvature flow and, moreover made us rethink what it means for surfaces to move at a specified speed in a generalized setting of measures.

桑 原 敏 郎 (筑波大数理物質) シンプレクティック特異点解消に付随する頂点代数 \cdots (13:00~14:00)

Toshiro Kuwabara (Univ. of Tsukuba) Vertex algebras associated with symplectic resolutions

概要 The central quotient of the universal enveloping algebra of a simple Lie algebra coincides with the algebra of differential operators on the flag manifold of the corresponding Lie group. Therefore, the enveloping algebra of a Lie algebra can be regarded as an algebra obtained by quantizing the coordinate ring of the cotangent bundle, which is a symplectic manifold, of the flag manifold. Relatively new algebras that have appeared in representation theory, such as rational Cherednik algebras and finite W-algebras, are also obtained as quantizations of the coordinate rings of symplectic manifolds that are not cotangent bundles, such as Nakajima quiver varieties and Slodowy varieties. Symplectic manifolds related to such noncommutative algebras are called symplectic resolutions. These are symplectic manifolds that provide a resolution of singularities for a Poisson manifold with singularities, where the morphism giving the resolution preserves the Poisson structure.

Vertex algebras are algebraic structures that can handle the structure of the enveloping algebra of affine Lie algebras, which are infinite-dimensional analogues of simple Lie algebras, in an algebraic manner. Just as simple Lie algebras and rational Cherednik algebras were described using algebras of differential operators on symplectic resolutions, we consider introducing new vertex algebras by constructing sheaves of free field vertex algebras, which are vertex algebra analogues of algebras of differential operators, such as the betagamma system, on symplectic resolutions. The sheaves of vertex algebras considered here are partly known as the theory of chiral differential operators (CDOs), but in general, they are a new class of objects that are vertex algebra analogues of sheaves of microlocal differential operators. It is nontrivial whether coordinate transformations between differential operators lift to coordinate transformations of free field vertex algebras, and in fact, nontrivial obstructions appear for the existence of such sheaves.

However, as a result of research, it has gradually become clear that such sheaves of vertex algebras can be explicitly constructed using BRST reduction (quantum Hamiltonian reduction) for at least some symplectic resolutions. Furthermore, it is gradually becoming clear that some of the vertex algebras constructed in this way coincide with vertex algebras arising from 3-4 dimensional conformal field theories studied by theoretical physicists. In this talk, I will explain what is currently known about vertex algebras constructed as sheaves of free field vertex algebras on symplectic resolutions.

- - 概要 Let A be a finite dimensional associative algebra. A left A-module X is called a brick if the endomorphism algebra of X is a skew-field. It is shown that bricks are in various conceptual correspondences with other important objects in representation theory. Consequently, study of bricks has received a lot of attentions. In our recent work, we study bricks and their properties from a less technical viewpoint and particularly through Hom-orthogonal modules. This leads to some non-trivial results on the algebraic and geometric properties of bricks, which ultimately relate to our studies of some open conjectures. Based on joint work with Charles Paquette.
- - 概要 Demonet-Iyama-Jasso introduced a new class of finite dimensional algebras, τ -tilting finite algebras. Recently, τ -tilting finiteness has been studied for various finite dimensional algebras since it relates to certain finiteness of other objects: brick finiteness, functorially finiteness of all the torsion classes, completeness of g-fans, and connectivity of silting complexes. For an algebraically closed field k of positive characteristic p and a finite group G, the classical result says that the representation type of a group algebra kG is determined by a p-Sylow subgroup of G. Hence, it is natural to ask what kinds of subgroups control τ -tilting finiteness of group algebras of finite groups. In this talk, we will explain that τ -tilting finiteness of group algebras of some semidirect products is determined by so-called p-hyperfocal subgroups.
- - 概要 Let p be a prime. Donovan's conjecture states that, for a given finite p-group P, there are only finitely many Morita equivalence classes of blocks of finite groups with defect groups isomorphic to P. In this talk, we show that the principal 2-blocks of infinite series of 2-dimensional general linear groups with wreathed Sylow 2-subgroups are Morita equivalent.

This result for V^{\dagger} was already proved by Dong-Mason in 2000.

- - 概要 In this talk, I will talk about the automorphism groups of parafermion vertex operator algebras associated with simple Lie algebra and positive integral level. The automorphism group is isomorphic to the automorphism group of the root system of the simple Lie algebra if (i) k is at least 3 or (ii) k is two and the simple Lie algebra is non simply laced.

 Kazuya Kawasetsu (Kumamoto Univ.) Rogers—Ramanujan exact sequences and free modules over free generalized vertex algebras
 - 概要 The notion of free modules over (generalized) vertex algebras is introduced and the Rogers-Ramanujan recursions are realized as short exact sequences among the free modules over free generalized vertex algebras. Some of them are equivalent to exact sequences introduced by S. Capparelli et al. Moreover, a polynomial analogue of the Rogers-Ramanujan recursions are realized as exact sequences among free modules over certain vertex algebras. As applications, we study the following topics in the related fields: $\widehat{\mathfrak{sl}}_2$ spaces of coinvariants $L_{1,0}^{N,\infty}(\mathfrak{n})$ introduced by B. Feigin et al., generalized q-Fibonacci recursions and (q,z)-series related to Urod vertex operator algebras.
- - 概要 (Affine) W-algebras are vertex algebras defined as quantum Hamiltonian reductions of affine vertex algebras. Madsen and Ragoucy introduced secondary Hamiltonian reductions to show that some W-algebras can be obtained as quantum Hamiltonian reductions of other W-algebras. The finite W-algebra analogs were also conjectured by Morgan and recently proved by Thibault Juillard and the speaker. I'll talk about recent developments in affine W-algebra cases. This is joint work with Thibault Juillard.

概要 Up until now, constructions such as "crossed products" in low-dimensional semisimple Hopf algebras have not been known in the context of Hopf superalgebras. In this talk, we introduce a new family of semisimple Hopf superalgebras and study its structure. Furthermore, we have shown that using this, the majority of semisimple Hopf superalgebras of dimension up to 10 over an algebraically closed field of characteristic zero can be realized. This is based on joint work with Taiki Shibata and Kenichi Shimizu.

概要 Skew brace is an algebraic structure that was introduced in the study of the Yang-Baxter equation and it may be viewed as an extension of group. There has been a trend to try and generalize concepts and techniques in the study of groups to that of skew braces. For example, recently factorizations, isoclinism, and Schur covers of skew braces have been studied. In this talk, we introduce the definition of skew brace representation that is due to Letourmy-Vendramin and Zhu. We explain why the analogs of results, such as Maschke's theorem and Clifford's theorem, hold for skew brace representations. We also give some examples to illustrate that irreducible representations are more difficult to understand for skew braces than for groups.

概要 Association scheme is a generalization of finite homogeneous spaces. The structure of association schemes induces a finite dimensional complex vector space with a matrix product, an Hadamard product, a transpose—conjugate, and a conjugate and a representation of the algebra with respect to the matrix product. The vector space is called the Bose—Mesner algebra of the association scheme. In this talk, we introduce a category of "algebras" that includes the Bose—Mesner algebra of association schemes as objects, and a functor from a category of association schemes to the category of "algebras".

ハイロンダオ (Univ. of Kansas) 局所特異点: 代数的・圏論的・組合せ論的側面 Hailong Dao (Univ. of Kansas) Local singularities: algebraic, categorical and combinatorial aspects

概要 Commutative algebra deals with algebraic structures such as rings, ideals and modules that arise from systems of polynomial equations over a field such as complex numbers or the integers. From a geometric point of view, one seeks to understand how far a commutative ring is from being nonsingular. There are many approaches to doing so, and they frequently reveal fascinating connections, ever since the birth of the subject.

In this talk, I will describe how the nature of singular rings (suitably called singularities) can be understood from different points of views: categorical (via categories of modules and complexes), homological (via behavior of co/homological functors and projective resolutions) and combinatorial (via simplicial co/homology). I will give examples to illustrates how such diverse view points enhance our understanding, and how many unexpected bridges between them remain to be discovered. I will also highlight the very important contributions of Japanese mathematicians, both in the past and the present, on these topics.

<u>Jun Horiuchi</u> (Nippon Inst. of Tech.) Matijevic-Roberts type theorems for certain graded rings Kazuma Shimomoto (Tokyo Tech)

概要 We want to show Matijevic-Roberts type theorems for certain graded rings. As an application, we can derive some ring theoretic properties of the associated graded rings.

 $\frac{\text{Ryo Ishizuka}}{\text{Kei Nakazato}} \hspace{0.1cm} \text{(Tokyo Tech)} \hspace{0.3cm} \text{A generalization of Kunz's theorem to mixed characteristic via } p\text{-adic} \\ \text{cohomology theory}$

概要 The regularity of positive characteristic Noetherian rings is characterized by the faithful flatness of the Frobenius map. This is known as Kunz's theorem. Bhatt-Iyengar-Ma generalized the theorem to mixed characteristic by using perfectoid rings instead of Frobenius maps. In recent years, thanks to Bhatt's insight, the "mixed characteristic Frobenius map" has been studied via certain p-adic cohomology (prismatic cohomology). In this talk, we will explain how the regularity of mixed characteristic rings is characterized by the faithful flatness of the Frobenius lift on prismatic cohomology.

Akihiro Higashitani (Osaka Univ.) Non-finitely generated monoids corresponding to finitely generated sub-Koichiro Tani (Osaka Univ.) algebras

概要 The goal of this talk is to study the possible monoids appearing as the associated monoids of the initial algebra of a finitely generated homogeneous k-subalgebra of a polynomial ring $k[x_1, \ldots, x_n]$. Clearly, any affine monoid can be realized since the initial algebra of the affine monoid k-algebra is itself. On the other hand, the initial algebra of a finitely generated homogeneous k-algebra is not necessarily finitely generated. In this talk, we provide a new family of non-finitely generated monoids which can be realized as the initial algebras of finitely generated homogeneous k-algebras. Moreover, we also provide an example of a non-finitely generated monoid which cannot be realized as the initial algebra of any finitely generated homogeneous k-algebra.

概要 Let A be a retract of the polynomial ring in three variables over a field k. It is known that if $\operatorname{char}(k)=0$ or $\operatorname{tr.deg}_k A\neq 2$ then A is a polynomial ring. In this talk, we give some sufficient conditions for A to be the polynomial ring in two variables over k when $\operatorname{char}(k)>0$ and $\operatorname{tr.deg}_k A=2$.

20 遠 藤 直 樹 (明大政治経済) Cohen-Macaulay normal Rees algebras of integrally closed ideals · · · · · 13

Naoki Endo (Meiji Univ.) Cohen-Macaulay normal Rees algebras of integrally closed ideals

概要 Let (R,\mathfrak{m}) be a regular local ring with $d=\dim R\geq 2$ and I an integrally closed \mathfrak{m} -primary ideal of R. In this talk, we investigate a classical question of when the Rees algebra $\mathcal{R}(I)$ of I becomes a Cohen–Macaulay normal domain. When d=2, for every integrally closed \mathfrak{m} -primary ideal I of R, Zariski proved that all the powers of I are integrally closed; Lipman and Teissier proved the reduction number of the ideal I is at most one. Thus $\mathcal{R}(I)$ is a Cohen–Macaulay normal domain. When $d\geq 3$, Goto (resp. Ciupercă) studied the case where I is a complete intersection ideal (resp. an almost complete intersection ideal), and proved that the Rees algebras $\mathcal{R}(I)$ of such ideals I are Cohen–Macaulay normal domains. Inspired by their results, we start our investigation by going over the ideals generated by d+2 elements.

$9:15\sim10:45$

概要 One of the central objects in the representation theory of quantum groups is the integrable modules. Although the quantum symmetric pair coideal subalgebras resemble to the quantum groups, their representation theory develops very slowly. For better understanding of the representation theory, I will introduce the notion of integrable modules for the quantum symmetric pair coideal subalgebras. As an evidence that our definition is the correct one, I will explain that the algebra of matrix coefficients of simple integrable modules over a quantum symmetric pair of finite type coincides with Bao-Song's quantized coorinate ring.

概要 Quasi-polynomials are periodic polynomials that appear in various problems in connection with to counting problems. In particular, Ehrhart quasi-polynomials in Ehrhart theory and characteristic quasi-polynomials in hyperplane arrangements have been studied extensively. Furthermore, in Ehrhart theory, the equivariant Ehrhart theory, which involves counting up including group actions, has been studied. In this talk, we show that the permutation representation associated with the mod q reduction of a lattice acted on linearly by a finite group is a quasi-polynomial. This study is aimed at the equivariant theory of characteristic quasi-polynomials in hyperplane arrangements. If time permits, we also discuss detailed studies for Weyl groups.

linear finite group action on a lattice

淺井聡太(東大数理) 傾理論の新潮流:semibrickとTF同値

Sota Asai (Univ. of Tokyo) New trends in tilting theory: semibricks and TF equivalences

概要 The representation theory of a finite-dimensional algebra A studies the module category over A. Such algebras naturally appear in many fields of mathematics, including quiver representations, Fukaya categories, cluster theory, quantum groups, and derived equivalences.

One of the important methods is tilting theory, which compare the module categories and their derived categories over two non-isomorphic algebras. Tilting theory started with quiver reflection functors of Bernstein–Gel'fand–Ponomarev, and then Rickard introduced tilting complexes and showed that they characterize derived equivalences. Tilting complexes were generalized to silting complexes in terms of mutation, motivated by cluster algebras of Fomin–Zelevinsky. Since then, tilting theory has grown rapidly by using silting complexes as a main means.

In this talk, I will survey such development of tilting theory, including newer tools semibricks and TF equivalences introduced by me. These are now accepted by many researchers as important and fundamental notions in tilting theory.

Semibricks are a generalization of semisimple modules in terms of Schur's lemma. They determine abelian subcategories of the module category closed under extensions. In my study, I defined a certain finiteness conditions called left finiteness for semibricks, and proved that left finite semibricks correspond bijectively to many important notions including 2-term silting complexes.

For further study, it is important to consider the real Grothendieck group $K_0(\mathsf{proj}A)_{\mathbb{R}} \simeq \mathbb{R}^n$. For each 2-term silting complex, the g-vectors of its indecomposable direct summands give a simplicial cone in $K_0(\mathsf{proj}A)_{\mathbb{R}}$, and these cones give a non-singular fan in $K_0(\mathsf{proj}A)_{\mathbb{R}}$ called the silting fan. Since this fan is not necessarily complete, I introduced an equivalence relation in $K_0(\mathsf{proj}A)_{\mathbb{R}}$ called the TF equivalence, and showed that the TF equivalence is indeed an extension of the silting fan.

13:00~14:00

概要 In this talk, we explore when a Noetherian local ring has a finite number of trace ideals. We proved that if a ring has a finite number of trace ideals, then the Krull dimension is at most two. Furthermore, if a given ring has positive depth and the integral closure of the ring is local, then the dimension of the ring must be one. In that case, we explore the condition of having a finite number of trace ideals regarding the value.

木 村 海 渡 (名大多元数理) Ext と Tor の消滅問題の反例の存在について 15 SLMath J. Lyle 也 (名大多元数理) 大 竹 優 亮 (名大多元数理) (Nagoya Univ.) On the existence of counterexamples for vanishing problems of Ext and Kaito Kimura Justin Lyle (SLMath) Tor Yuya Otake (Nagoya Univ.) Ryo Takahashi (Nagoya Univ.)

概要 We prove that there exist a Gorenstein equicharacteristic local unique factorization domain R having an isolated singularity such that $\operatorname{Tor}_{>0}^R(L,M)=0$ does not imply that the pair (L,M) satisfies Auslander's depth formula, and a Cohen–Macaulay local unique factorization domain S having an isolated singularity such that $\operatorname{Ext}_S^{>0}(N,S)=0$ does not imply the total reflexivity of N.

概要 It is known that a 3-dimensional cubic AS-regular algebra A is geometric, so we can write $A = \mathcal{A}(E, \sigma)$ where E is $\mathbb{P}^1 \times \mathbb{P}^1$ or curves of bidegree (2,2) in $\mathbb{P}^1 \times \mathbb{P}^1$, and $\sigma \in \operatorname{Aut}_k E$. In this talk, in terms of a geometric algebra, we determine the defining relations of A in the cases that the point schemes of A are reducible curves of bidegree (2,2) in $\mathbb{P}^1 \times \mathbb{P}^1$. Also, by calculating the twisted superpotential corresponding to A, we check the AS-regularity of A. By the results of Matsuno–Saito and our result in this talk, we give the list of the defining relations of 3-dimensional cubic AS-regular algebra whose point schemes are reducible.

29 吉 井 豊 (茨 城 大 教 育) 単純代数群の超代数における積が定めるいくつかの線形同型写像 · · · · · 10 Yutaka Yoshii (Ibaraki Univ.) Some linear isomorphisms induced by the multiplication in the hyperalgebra of a simple algebraic group

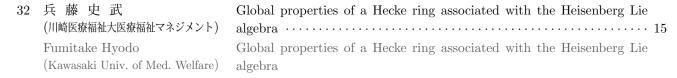

概要 Let G be a simply connected simple algebraic group defined and split over \mathbb{F}_p and \mathcal{U} a hyperalgebra of $G_{\mathbb{F}_p}$. We report that some \mathbb{F}_p -linear isomorphisms can be obtained from the multiplication in \mathcal{U} , using an \mathbb{F}_p -linear map which splits the Frobenius endomorphism on \mathcal{U} .

概要 A dg category is an enriched category over the monoidal category of cochain complexes of k-vector spaces. Dg categories possess a notion of weak equivalences called quasi-equivalences, and one can construct the localization HodgCat of the category of dg categories with respect to quasi-equivalences. In this talk, we introduce a 2-category (more precisely, a bicategory) that serves as a natural refinement of HodgCat, and show that it is equipped with the additional structure of a proarrow equipment. Proarrow equipments are known as a framework for formal category theory and make it possible to talk about (co)limits in an abstract way. Applying this theory, we explain how the pretriangulatedness of dg categories can be understood as a certain kind of completeness.

概要 For any commutative finite flat group scheme, Grothendieck constructed an embedding into some smooth group scheme. This embedding is called the Grothendieck resolution. Let p be a prime number and n a positive integer. We consider the Grothendieck resolution for a certain finite flat commutative group scheme of order p^n over an \mathbb{F}_p -algebra.

概要 This study concerns (not necessarily commutative) Hecke rings associated with certain algebras and describes a formal Dirichlet series with coefficients in the Hecke rings, which can be used to generalize Shimura's series. Considering the case of the Heisenberg Lie algebra, an analog of the identity for Shimura's series derived employing the rationality theorem, presented by Hecke and Tamagawa, is established. Moreover, this analog recovers the explicit formulae for the isomorphic zeta function and pro-isomorphic zeta function of the Heisenberg Lie algebra shown by Grunewald, Segal and Smith.

Akinari Hoshi (Niigata Univ.) Norm one tori and Hasse norm principle, III: Degree 16 case

Kazuki Kanai (Kure Nat. Coll. of Tech.)

Aiichi Yamasaki (Kyoto Univ.)

概要 Let k be a field, T be an algebraic k-torus, X be a smooth k-compactification of T and $\operatorname{Pic} \overline{X}$ be the Picard group of $\overline{X} = X \times_k \overline{k}$ where \overline{k} is a fixed separable closure of k. Hoshi, Kanai and Yamasaki [HKY22], [HKY23] determined $H^1(k,\operatorname{Pic} \overline{X})$ for norm one tori $T = R_{K/k}^{(1)}(\mathbb{G}_m)$ and gave a necessary and sufficient condition for the Hasse norm principle for extensions K/k of number fields with $[K:k] \leq 15$. Among 1954 transitive subgroups $G = 16Tm \leq S_{16}$ up to conjugacy, we determine 1101 (resp. 774, 31, 37, 1, 1, 9) cases with $H^1(k,\operatorname{Pic} \overline{X}) = 0$ (resp. Z/2Z, $(Z/2Z)^{\oplus 2}$, $(Z/2Z)^{\oplus 3}$, $(Z/2Z)^{\oplus 4}$, $(Z/2Z)^{\oplus 6}$, Z/4Z). We see that $H^1(k,\operatorname{Pic} \overline{X}) = 0$ implies that the Hasse norm principle holds for K/k. Moreover, we give a necessary and sufficient condition for the Hasse norm principle for K/k with [K:k] = 16 for 22 primitive G = 16Tm cases.

34足立大雅 (九大JGMI)
水野 宏亮 (名大多元数理)Iwasawa theory for weighted graphs15舘野 荘平 (名大多元数理)Taiga Adachi (Kyushu Univ.)
Kosuke Mizuno (Nagoya Univ.)Iwasawa theory for weighted graphsSohei Tateno (Nagoya Univ.)

概要 In this talk, by generalizing Iwasawa theory for graphs initiated by Gonet and Vallières to weighted graphs, we establish Iwasawa theory for weighted graphs. In particular, we define the Iwasawa invariants for \mathbb{Z}_p^d -covers of weighted graphs following Cuoco–Monsky and prove the analogue of Iwasawa's class number formula for \mathbb{Z}_p^d -covers of weighted graphs, which is a generalization of results of DuBose–Vallières and Kleine–Müller. These invariants also allow us to consider the analogue of Kida's formula for \mathbb{Z}_p^d -covers of graphs. We also provide several numerical examples.

概要 As an analogous study of Greenberg's conjecture, we consider the vanishing of the Iwasawa invariants of non-cyclotomic \mathbb{Z}_2 -extensions of some quartic number fields, which are unramified outside a prime $(1+\sqrt{-7})/2$ of the imaginary quadratic field of discriminant -7, and give some criteria including an analogue of a basic theorem of Ozaki and Taya.

36 田島凌太 (九大 J G M I) The p-adic constant for mock modular forms and the degree of a certain modular parameterization of CM elliptic curves. $\cdots 15$

Ryota Tajima (Kyushu Univ.) The *p*-adic constant for mock modular forms and the degree of a certain modular parameterization of CM elliptic curves.

概要 Let $g \in S_k(\Gamma_0(N))$ be a normalized newform and F be a harmonic Maass form that is good for g. Then there exists a unique p-adic constant α_g and we obtained a p-adic modular form from α_g and the holomorphic part F^+ . When g has a complex multiplication by an imaginary quadratic field K and $p \nmid N$ is split in \mathcal{O}_K , it is known that $\alpha_g = 0$. On the other hand, the speaker showed that α_g is a p-adic unit for an inert prime $p \nmid 2N$ when $\dim_{\mathbb{C}} S_k(\Gamma_0(N)) = 1$. In this talk, we consider a weight 2 normalized CM form g with rational integer Fourier coefficients and E denotes an elliptic curve corresponding to g. Then, there exists a modular parameterization of E associated to the period lattice of g. We denote the degree of this map by C_g . The speaker proved that $C_g\alpha_g$ is a p-adic unit for almost all inert prime p. In this talk, I will explain this result.

概要 We prove that Hecke eigenvalues for any Hilbert and Siegel modular forms are algebraic integers. As an application, we give the growth of the fields of rationality of cuspidal automorphic representations of GL(2d) for a prime number d with non-vanishing central L-values. We also apply the integrality of Hecke eigenvalues for holomorphic Siegel cusp forms of general degree in order to give the growth of the Hecke fields of those forms.

概要 Height functions are fundamental tools in number theory, and their behavior itself is an intriguing subject of study. For instance, Schanuel has demonstrated the asymptotic behavior of the number of rational points with bounded height in N-dimensional projective space over number fields. On the other hand, an analog of the height function in discrete dynamical systems has been defined by Call and Silverman, which is also useful for extracting arithmetic information from dynamical systems. In this talk, we will discuss the number of rational points with bounded dynamical height. The discussion will be conducted by constructing a zeta function from the dynamical height function and examining it.

43 高 津 大 樹 (東京理大創域理工) K3 曲面の自己同型群とその実質的コホモロジー次元について 15 Taiki Takatsu (Tokyo Univ. of Sci.) On automorphism groups of K3 surfaces and their virtual cohomological dimension

概要 In this talk, we discuss the virtual cohomological dimension of automorphism groups of K3 surfaces. We apply the Bestvina–Mess type formula for relatively hyperbolic groups, which is established by Tomohiro Fukaya, to automorphism groups of K3 surfaces, and we show that the virtual cohomological dimension of automorphism groups of K3 surfaces determined by the covering dimension of the blown-up boundaries associated with their ample cones.

Hisashi Usui An example of the explicit generators of the Mordell–Weil lattice of a (Gunma Nat. Coll. of Tech.) supersingular elliptic K3 surface in characteristic 11

概要 We consider the Mordell-Weil lattice of the elliptic curve

$$E^{(12)}: y^2 = x^3 + t^{12} + 1$$

defined over k(t), where $k = \mathbb{F}_{11^2} = \mathbb{F}_{11}[s]/(s^2+1)$. The associated elliptic surface is a supersingular K3 surface of Artin invariant $\sigma_0 = 1$. So the discriminant of the Néron–Severi lattice is $-\operatorname{char}(k)^{2\sigma_0} = -11^2$. We give the explicit generators of the Mordell–Weil lattice and the Néron–Severi lattice of the associated elliptic surface.

概要 The higher Chow group $CH^p(X,q)$ is a generalization of the classical Chow group. It satisfies many interesting properties, but their structures are still mysterious for almost all varieties when p > 1. In this talk, I will explain an explicit construction of higher Chow cycles in $CH^2(X,1)$ on some K3 surfaces X with a non-symplectic involution, or a purely non-symplectic automorphism of order 4. By computing their images under the regulator map, I show that for very general cases, these cycles is non-torsion in $CH^2(X,1)_{\text{ind}}$, which is the quotient of $CH^2(X,1)$ by the images of the intersection product maps. The key for the proof is to find a convenient variant of Jacobians for higher cycles. Some examples in this talk are obtained in a joint work with Shohei Ma.

Kenta Hasizume (Niigata Univ.) On minimal model theory for polarized log pairs

概要 Minimal model theory is a fundamental tool to study birational geometry. Especially, the theory is indispensable to partial resolutions of singularities and moduli problems. In 2010, the breakthrough has been made by Birkar—Cascini—Hacon—McKernan. They have established the minimal model theory for polarized Kawamata log terminal pairs. After that, a remarkable progress in the log canonical case has been made by Fujino, Birkar, and Hacon—Xu. In this talk, I will introduce a recent development of the minimal model theory for polarized log pairs.

概要 We describe the moduli of 4-dimensional subalgebras of the full matrix ring of degree 3. We show that the moduli scheme has three irreducible components, whose relative dimensions over \mathbb{Z} are 5, 2, 2, respectively.

<u>Takuya Saito</u> (Hokkaido Univ.) Recent developments in the combinatorics of discriminantal arrange-Simona Settepanella (Torino Univ.) ments

Pragnya Das

ダスプラギア

- 概要 A hyperplane is a linear subspace of codimension 1, and a finite set of hyperplanes is called a hyperplane arrangement \mathcal{A} . A discriminantal arrangement $\mathcal{B}(\mathcal{A})$ is a hyperplane arrangement induced in the space of parallel translations of a given arrangement \mathcal{A} . In this presentation, we will discuss recent developments in the combinatorics of discriminantal arrangements.

Akihiro Higashitani (Osaka Univ.) Norihiro Nakashima Characteristic quasi-polynomials of restrictions of Shi arrangements of type B

(Nagoya Inst. of Tech.)

概要 Kamiya, Takemura, and Terao introduced a characteristic quasi-polynomial which enumerates the numbers of elements in the complement of hyperplane arrangements modulo positive integers. We compute the characteristic quasi-polynomials of restrictions of the Shi arrangement of type B by one given hyperplane. As a corollary, we determine when the characteristic quasi-polynomials of deletions of the Shi arrangement of type B are polynomials. This implies the partial solution for the conjecture regarding period collapse.

Nobukazu Kowaki (Osaka Univ.) Tropical hyperplane arrangements and combinatorial mutations of the matching field polytopes of Grassmannians

概要 A sequence of combinatorial mutations of matching field polytopes preserves the property of giving rise to a toric degeneration of Grassmannians. In this paper, we find a way to check that two matching field polytopes are combinatorial mutation equivalence using tropical hyperplane arrangements, "literally at a glance". Our way can prove that block diagonal matching fields are combinatorial mutations equivalent to diagonal matching fields. This is one of main results in [2]. Our result can be regarded as a generalization of that result.

Kota Saito Arithmetic properties of the integer and fractional parts of a sequence (Univ. of Tsukuba/Sophia Univ.)

概要 For every real number x, we define $\lfloor x \rfloor$ as the integer part of x, and $\{x\} = x - \lfloor x \rfloor$ as the fractional part of x. The speaker will talk about a series of studies on the integer parts and fractional parts of sequences. First, we will examine $\lfloor n^{\alpha} \rfloor$ $(n=1,2,\ldots)$. This sequence is called the Piatetski-Shapiro sequence (with exponent α). In this research, we considered the problem of whether there exists $\alpha > 3$ such that $\lfloor p^{\alpha} \rfloor + \lfloor q^{\alpha} \rfloor = \lfloor r^{\alpha} \rfloor$ has a solution (p,q,r) of positive integers. Considering Fermat's equation, we could expect that there is no such α . However, by collaborating with Toshiki Matsusaka, we find infinitely many such α 's. The speaker plans to introduce other studies and results on Diophantine equations involving integer parts.

The speaker next will discuss the randomness of the b-adic expansion of an algebraic irrational number α . This problem is essentially equivalent to examining the distribution of $\{b^n\alpha\}$ $(n=1,2,\ldots)$. Borel conjectured that the b-adic expansion of an algebraic irrational number would be sufficiently random. For instance, if Borel's conjecture is true, then the probability that the digit 1 appears in the binary expansion of $\sqrt{2}$ should be 1/2 like a coin toss. However, even the positivity of this probability is unknown. Despite these difficulties, by collaborating with Yuya Kanado, we revealed a strong relationship between the randomness of $\{b^n\alpha\}$ and the Riemann zeta function. In other words, we succeeded in linking two fields of research that had been studied independently through a completely different approach.

Lastly, we will discuss $\lfloor A^{3^n} \rfloor$ $(n=1,2,\ldots)$. In 1947, Mills constructed a real number A>1 such that this sequence is always prime. The smallest such A>1 is called Mills' constant. Although there may be different opinions, we could say that the question of whether Mills' constant is irrational has been unsolved for over 70 years. However, the speaker has successfully proved the irrationality of Mills' constant by using a simple idea. If time permits, the speaker will also discuss a partial result of its transcendency.

理) 任 鑫(阪 大 Arithmetic on q-deformed rational numbers $\cdots 15$ 小木曽岳義(城 西 大 理) 宮本賢伍(茨城大工) 和 久 井 道 久 (関西大システム理工) 柳川浩二(関西大システム理工) (Osaka Univ.) Xin Ren Arithmetic on q-deformed rational numbers Takeyoshi Kogiso (Josai Univ.) Kengo Miyamoto (Ibaraki Univ.) Michihisa Wakui (Kansai Univ.) Kohji Yanagawa (Kansai Univ.)

概要 The q-deformed rational numbers were introduced by Morier-Genoud and Ovsienko based on continued fractions and Euler q-integers. This work is related to many directions including Teichmüller spaces, the 2-Calabi-Yau category of type A_2 , the Markov-Hurwitz approximation theory, the modular group and Picard groups, the Jones polynomials of rational knots, and combinatorics on fence posets. In this talk, we give an arithmetic property on q-deformed rational numbers. For two rational numbers with the same denominator, their q-deformed denominator polynomials may not be equal. We give a sufficient condition for their denominator polynomials to be equal.

概要 A k-generalized Markov number refers to an integer that appears in the positive integer solutions of the k-generalized Markov equation $x^2 + y^2 + z^2 + k(yz + zx + xy) = (3+3k)xyz$. The k-generalized Markov equation possesses an algorithm that generates two distinct positive integer solutions from a single positive integer solution, forming a tree structure through this algorithm. In this talk, we will introduce two types of elements in $SL(2,\mathbb{Z})$ that have a k-generalized Markov number as their (1,2)-entry and show how these elements preserve the tree structure of the positive integer solutions of the k-generalized Markov equation.

概要 In 1947, Lehmer conjectured that Ramanujan's τ -function never vanishes, where the function τ : $\mathbb{Z}_{>0} \longrightarrow \mathbb{Z}$ is defined by

$$x \prod_{n \ge 1} (1 - x^n)^{24} = \sum_{n \ge 1} \tau(n) x^n.$$

This conjecture is still open.

It is natural to consider whether any given integer belongs to the image of τ -function. Recently, it is proved that $\pm \ell, \pm 2\ell, \pm 2\ell^2$ are not τ -values, where $\ell < 100$ is an odd prime by Balakrishnan, Ono, Craig and many other people. The speaker proved that $\pm \ell, \pm 2\ell, \pm 4\ell, \pm 8\ell$ are not τ -values except for 14 cases, where $\ell < 1000$ is an odd prime.

Yuya Kanado (Nagoya Univ.) Normality of algebraic numbers and the Riemann zeta function Kota Saito (Univ. of Tsukuba/Sophia Univ.)

概要 A real number α is called simply normal to base b if its base-b expansion has each digit appearing with average frequency tending to 1/b. Moreover, α is called normal to base b if α is simply normal to base b^h for all natural numbers h. In this talk, we discuss a relation in between the normality of algebraic numbers and a mean value of the Riemann zeta function on arithmetic progressions. As a consequence, we show that

$$\lim_{N \to \infty} \frac{1}{\log N} \sum_{1 \le |n| \le N} \zeta \left(-k + \frac{2\pi i n}{\log b} \right) \frac{e^{2\pi i n \frac{\log \alpha}{\log b}}}{n^{k+1}} = 0$$

holds for all non-negative integers k if and only if α is normal to base b. This is joint work with Kota Saito (University of Tsukuba).

Tomohiro Yamada On an analogue of superperfect numbers involving both ordinary and (Kobe Univ./Osaka Univ.) infinitary divisors

概要 For integers $k=0,1,\ldots, k$ -ary divisors of an integer N are defined. 0-ary divisors are ordinary divisors of N. A divisor d of an integer N is k-ary if the greatest common (k-1)-ary divisor of d and N/d is one and infinitary if d is a k-ary divisor of N for sufficiently large k. We write $\sigma^{(k)}(N)$ and $\sigma^{(\infty)}(N)$ for the sum of (positive) k-ary divisors and infinitary divisors of N respectively. We determine all odd solutions N to $\sigma^{(\infty)}(\sigma(N)) = 2N$.

63 北島雅也(名大多元数理) 円を一般化した閉曲線の格子点問題と対応する一般化 Bessel 関数 · · · · · 15
Masaya Kitajima (Nagoya Univ.) Generalized Bessel functions corresponding to lattice point problems of generalized circles

概要 The lattice point problems of the p-circles, which generalized circles for positive real numbers p, have been solved for approximately p more than 3, based on the series representation of the error term using the generalized Bessel functions by E. Krätzel and the results of G. Kuba. On the other hand, for the cases 0 , the method via this series representation cannot make progress. Therefore, in this talk, I will discuss the speaker's result that certain functions closely related to the problems can be displayed as a series by a newly generalized Bessel function based on the property <math>p-radial, generalization of spherical symmetry, and highlight the possibility that attempts to solve the problems via this display are suitable especially for the cases 0 .

10 小林和志(三重大教育) 複素トーラス上における一般化された複素構造に対するある B-場変形に ついて・・・・・・・・・・・15 On a B-field transform of generalized complex structures over complex Kazushi Kobayashi (Mie Univ.) 概要 Let (X^n, \check{X}^n) be a mirror pair of an *n*-dimensional complex torus X^n and its mirror partner \check{X}^n . Then, by SYZ transform, we can construct a holomorphic line bundle with an integrable connection from each pair of a Lagrangian section of $\check{X}^n \to \mathbb{R}^n/\mathbb{Z}^n$ and a unitary local system along it, and those holomorphic line bundles with integrable connections forms a dg-category DG_{X^n} . In this talk, we focus on a certain B-field transform of the generalized complex structure induced from the complex structure on X^n , and interpret it as the deformation $X_{\mathcal{G}}^n$ of X^n by a flat gerbe \mathcal{G} . Moreover, we construct the deformation of DG_{X^n} associated to the deformation from X^n to $X^n_{\mathcal{G}}$, and also discuss the homological mirror symmetry between X_G^n and its mirror partner on the object level. Gross-Siebert プログラムと非アルキメデス的 SYZ ファイブレーション 山本悠登(理化学研iTHEMS) (RIKEN) The Gross-Siebert program and non-archimedean SYZ fibrations Yuto Yamamoto 概要 For a maximally degenerate Calabi-Yau variety, the Berkovich retraction associated with a (good) minimal dlt model is regarded as an SYZ fibration in non-archimedean geometry. In general, the integral affine structure induced on the base space of the fibration differs from the one defined for the dual intersection complex of a toric degeneration in the Gross-Siebert program. In this talk, using tropical geometry, we construct non-archimedean SYZ fibrations whose bases are integral affine manifolds appearing in the Gross-Siebert program for Calabi-Yau complete intersections of Batyrev-Borisov. 秦泉寺雅夫(岡山大自然) Elliptic virtual structure constants and generalizations of BCOV-Zinger 12formula to projective fano hypersurfaces · · · · · · · 15 健(香川高専) 桑田 Elliptic virtual structure constants and generalizations of BCOV-Zinger Masao Jinzenji (Okayama Univ.) Ken Kuwata formula to projective fano hypersurfaces (Kagawa Nat. Coll. of Tech.) 概要 In this talk, we propose a recipe for B-model computation of genus 1 Gromov-Witten invariants of Calabi-Yau and Fano Projective Hypersurfaces. Our formalism can be applied equally to both Calabi-Yau and Fano cases. In Calabi-Yau case, drastic cancellation of terms used in our formalism occurs and it results in another representation of BCOV-Zinger formula for projective Calabi-Yau hypersurfaces. 巡回 Higgs 東上の調和計量の相互の揃わなさの度合いの定量化とその評価 宮 武 夏 雄 (東北大MathCCS) Natsuo Miyatake (Tohoku Univ.) Quantification and evaluation in the degree of mutual misalignment of harmonic metrics on cyclic Higgs bundles

概要 Let X be a Riemann surface and $K_X \to X$ the canonical bundle. For each integer $r \geq 2$, each $q \in H^0(K_X^r)$, and each choice of the square root $K_X^{1/2}$ of the canonical bundle, we canonically obtain a Higgs bundle, which is called a cyclic Higgs bundle. In this talk, I will introduce a function called entropy that quantifies the degree of mutual misalignment of harmonic metrics on cyclic Higgs bundles and provide an estimate for the entropy.

入谷 寛(京 大 理) 爆発の量子コホモロジー

Hiroshi Iritani (Kyoto Univ.) Quantum cohomology of blowups

概要 Quantum cohomology is a deformation of the cohomology ring of a smooth projective variety defined by counting rational curves. The relationship between quantum cohomology and birational geometry has attracted much interest. In this talk, I will explain the following decomposition theorem for quantum cohomology of blowups: the quantum cohomology of the blowup \tilde{X} of X along a smooth subvariety Z is a direct sum of the quantum cohomology of X and $(\operatorname{codim}(Z) - 1)$ copies of the quantum cohomology of Z. The proof idea is based on a D-module version of Teleman's conjecture, which relates the quantum cohomology of a GIT quotient to the equivariant quantum cohomology of the original manifold via Fourier transformation.

今野北斗(東大数理) Diffeomorphism group and gauge theory

Hokuto Konno (Univ. of Tokyo) Diffeomorphism group and gauge theory

概要 The group of diffeomorphisms of a given smooth manifold is a fundamental object of study for topologists and geometers. One of the major advances in topology over the past decade concerns diffeomorphism groups of higher-dimensional manifolds, led by many researchers such as Galatius and Randal-Williams. On the other hand, it has been well-known since the last century that 4 is a special dimension in the classification of manifolds. Special phenomena are typically described in terms of comparisons between the topological and smooth categories, and they are detected using gauge theory. In recent years, advances in gauge theory for families have revealed that special phenomena in dimension 4 also occur for diffeomorphism groups in various ways, contrasting with recent results in higher dimensions. I will survey these new special phenomena in dimension 4, also from the perspective of comparisons between the topological and smooth categories.

細野 忍(学習院大理) カラビ・ヤウ多様体の族とミラー対称性

Shinobu Hosono (Gakushuin Univ.) Families of Calabi-Yau manifolds and mirror symmetry

概要 Mirror symmetry of Calabi—Yau manifolds is a mysterious symmetry that interchanges the complex geometry of one Calabi—Yau manifold with the symplectic geometry of another Calabi—Yau manifold, called a mirror manifold. 30 years after its discovery, we now have fascinating proposals, such as homological mirror symmetry and SYZ geometric mirror construction, to describe the symmetry mathematically. In this talk, however, I will describe this symmetry in terms of two different, and classical, nilpotent linear actions associated with a Calabi—Yau manifold. One is the Lefschetz action in the hard Lefschetz theorem (which I call A-structure), and the other is a certain monodromy action that arises from a family of Calabi—Yau manifolds (B-structure). I define mirror symmetry as the symmetry which exchanges these two structures. The general existence of a mirror Calabi—Yau manifold for a given Calabi—Yau manifold is still an open problem. However, mirror symmetry defined by these classical actions motivates us to study/construct families of Calabi—Yau manifolds, and to look into the boundary points where Calabi—Yau manifolds degenerate in a specific way. Based on my collaborations with Hiromichi Takagi since 2010, I will present interesting families of Calabi—Yau threefolds which are parametrized by two-dimensional toric varieties.

概要 A compact Lie group G equipped with a bi-invariant Riemannian metric is a Riemannian symmetric space. The symmetry s_x at x is given by $s_x(y) = xy^{-1}x$. A subset S of G is called an antipodal set if $s_x(y) = y$ holds for any x and y in S. When S is a maximal antipodal set containing the identity element, S is a subgroup of G, which is called a maximal antipodal subgroup. We show that all of the maximal antipodal subgroups in compact Lie groups, which are not necessarily connected, do not change through covering homomorphisms with odd degree.

36		双対平坦空間における平面曲線論と特異点論 · · · · · · · · · · · · 15 rually flat geometry of plane curves and singularity theory
	(Shibaura Inst. of Tech.)	

概要 In the Euclidean plane, classically, it is well-known that extrinsic differential geometric invariants of curves are characterized by singularities of the corresponding envelope, and the singularities are analyzed by the distance-squared functions. In this presentation, I would like to talk about our generalization of the results in the Euclidean space to the ones in a dually flat space, introduced by Amari and Nagaoka to geometrically investigate various fields such as statistics, machine learning, and so on. Additionally, I would like to introduce an application of our results to maximum likelihood estimation in statistics.

概要 A statistical manifold is a pseudo-Riemannian manifold endowed with a Codazzi structure. This structure plays an important role in Information Geometry and its related fields, e.g., a statistical model admits this structure with the Fisher-Rao metric. In practical application, however, the metric may be degenerate, and then this geometric structure is not fully adapted. In this study, for such cases, we introduce the notion of quasi-Codazzi structure which consists of a possibly degenerate metric and a pair of coherent tangent bundles with affine connections. As a special case, the quasi-Codazzi structure with flat connections coincides with the quasi-Hessian structure previously studied by Nakajima—Ohmoto.

39 成 田 知 将 (名大多元数理) マジョリゼーションに関連する凸幾何学のグラフ実現問題への応用 · · · · 15 Kazumasa Narita (Nagoya Univ.) Geometric interpretation of majorization and its application to graph realization problem

概要 Majorization is an important combinatorial notion that has applications in many areas of mathematics. In 1952, Rado gave a geometric characterization of majorization. By applying this theorem due to Rado, the speaker characterized when a finite sequence of nonnegative real numbers is realized as the degree sequence of some weighted uniform hypergraph. This theorem is an extension of a theorem due to Hakimi (1962). The speaker also studied the properties of the closed convex polytope associated with the set of hypergraphs with a given degree sequence.

概要 We compute (co)homologies of ideal boundaries of free products of geodesic coarsely convex spaces in terms of those of each of the components. The (co)homology theories we consider are, K-theory, Alexander-Spanier cohomology, K-homology, and Steenrod homology. These computations led to the computation of K-theory of the Roe algebra of free products of geodesic coarsely convex spaces via the coarse Baum-Connes conjecture.

概要 A Euclidean space with a Gaussian distribution is called a Gaussian space. The limit object of Gaussian spaces as the dimension diverges to infinity in the pyramid sense is well-studied. This is a central figure in the study of infinite dimensional limit of Riemannian manifolds. In this talk, we study an l_p -normed space with a Gaussian distribution instead of the Euclidean norm. When $p \geq 2$, it is easy to capture its infinite dimensional limit object. On the other hand, when p < 2, the situation is different. We determine the limit of l_p -normed Gaussian spaces with suitable scaling as the dimension diverges to infinity, and then apply it to the phase transition phenomenon of convergence of l_p -product spaces.

- 概要 In this talk, we introduce a domain of complex 2 dimension which contains the real 2 dimensional hyperbolic disk and 2 sphere in a special way. This approach enables us to unify the hyperbolic geometry and spherical geometry of real 2 dimension in a holomorphic manner. We apply this idea to show convergence of the Wick star product.
- 4 松 崎 克 彦 (早 大 教 育) ジグムント連続な微分をもつ微分同相写像のタイヒミュラー空間 15 Katsuhiko Matsuzaki (Waseda Univ.) The Teichmüller space of circle diffeomorphisms in the Zygmund smooth class
 - 概要 We provide the complex Banach manifold structure for the Teichmüller space of circle diffeomorphisms whose derivatives are in the Zygmund class. This is done by showing that the Schwarzian derivative map is a holomorphic split submersion. We prove similar results for the pre-Schwarzian derivative map and investigate the fiber space over the Teichmüller space. Especially, we show that this projection is also a holomorphic split submersion and induces the structure of a disk bundle. Finally, we introduce the little Zygmund class and consider the closed subspace given by this family of mappings in the Teichmüller space.

Kento Sakai (Osaka Univ.) Degeneration of hyperbolic surfaces with boundary via harmonic maps

概要 Using harmonic maps from a punctured Riemann surface to hyperbolic surfaces with totally geodesic boundaries, we obtain a parametrization of Teichmüller space. The parametrization space is the space of meromorphic quadratic differentials on the punctured Riemann surface. In this talk, we consider the degeneration of hyperbolic surfaces parametrized by a ray from the origin in the space of meromorphic quadratic differentials. In particular, taking the universal covers of the Riemann surface, we show the normalized metric spaces of the hyperbolic surfaces converge to the R-tree which is determined by the direction of the ray. Here, we discuss the convergence in the sense of Gromov—Hausdorff.

馬場伸平(阪大理) Bers' simultaneous uniformization theorem and complex projective structures on Riemann surfaces

Shinpei Baba (Osaka Univ.) Bers' simultaneous uniformization theorem and complex projective structures on Riemann surfaces

概要 Bers' simultaneous uniformization theorem is a generalization of the uniformization theorem of Riemann surfaces. It establishes a bijective correspondence between pairs of Riemann surface structures and typical discrete faithful representations into $PSL(2,\mathbb{C})$. Bers' original proof is based on the quasi-conformal deformation theory. In this talk, we outline a new proof, using the intersection of holonomy varieties.

The deformation space of complex projective structures on a Riemann surface is identified with the vector space of holomorphic quadratic differentials on the surface. This vector space properly embeds into the space of representations of the surface group into $PSL(2,\mathbb{C})$, so that its image is a smooth analytic subvariety. Given two marked Riemann surface structures on the same topological surface, we show that the intersection of their corresponding subvarieties is a discrete set. From this, one can reprove the simultaneous uniformization theorem.

概要 The problem whether the Jacobian variety of a hyperelliptic curve is isogenous to the direct product of the Jacobian varieties of hyperelliptic curves of lower genera is considered in many papers. This problem is naturally connected with the following well-known problem: Let solutions of differential equations and dynamical systems in terms of hyperelliptic functions are given. Under conditions when a reduction of these functions to hyperelliptic functions of lower genera is possible, find an explicit form of these solutions in terms of hyperelliptic functions of lower genera. In our previous work, we solve this problem for a class of hyperelliptic curves of genus 2. In this talk, we generalize our previous results to the case of genus 2g for any positive integer g.

- - 概要 We consider a system of differential-difference equations satisfied by the Gauss hypergeometric function. By using the Laplace transform with respect to parameters we get an integral representation of solutions in the form of the triple complex integral. By using the gauge transformation the well-known integral representation of solutions is also obtained. Similar results hold for confluent hypergeometric functions as well.

	Tatsuya Hosoi (Univ. of Tokyo) A study on the bilinear equation of the sixth Painlevé transcendents Hidetaka Sakai (Univ. of Tokyo)
	概要 The sixth Painlevé equation is a basic equation among the non-linear differential equations with three fixed singularities, corresponding to Gauss's hypergeometric differential equation among the linear differential equations. It is known that 2nd order Fuchsian differential equations with three singular points are reduced to the hypergeometric differential equations. Similarly, for nonlinear differential equations, we would like to determine the equation from the local behavior around the three singularities. In this paper, the sixth Painlevé equation is derived by imposing the condition that it is of type (H) at each three singular points for the homogeneous quadratic 4th-order differential equation.

	Tatsuya Hosoi (Univ. of Tokyo) Formal series solutions of fourth-order homogeneous quadratic differential equations with complex powers depending on initial values and their convergence
	概要 It is known that all tau functions of the Painleve equations satisfy the fourth-order quadratic differential equation. Among them, for the III, V, and VI equations, it is possible to express the formal series solutions combinatrically by using conformal blocks. In this paper, we show the convergence of the formal series, including the solutions of more general equations. The convergence of the conformal block function also follows in the case $c=1$ by the absolute convergence of tau series, since it is a partial sum of the tau series. We also characterized the form of a homogeneous quadratic equation with a series solution similar to the tau functions of the Painleve equations.
6	西 口 純 矢 (東北大AIMR) 線型遅延微分方程式の軟解の正則性について · · · · · · · 12 Junya Nishiguchi (Tohoku Univ.) On regularity of mild solutions for linear delay differential equations
	概要 The notion of mild solutions for linear delay differential equations (DDEs) has been introduced in [J. Nishiguchi, Electron. J. Qual. Theory Differ. Equ. 2023 , No. 32, 1–77] for the purpose of defining fundamental matrix solutions and obtaining a variation of constants formula for linear DDEs. This notion gives a definition of solutions to linear DDEs under discontinuous history functions. For a given linear DDE, the fundamental matrix solutions are locally absolutely continuous on the interval $[0, \infty)$, however, it is not apparent that the same property is true for the mild solutions. Here we obtain a result which shows the regularity of mild solutions by proving the local absolute continuity of a function obtained by the history segment of a locally absolutely continuous function.

Ayuki Sekisaka (Meiji Univ.) Eigenvalue problem and the Evans function of reaction-diffusion systems Hiroko Yamamoto (RIKEN) in cylinder domains

概要 To study the stability problem of solutions of reaction-diffusion systems in cylindrical domains, we consider the eigenvalue problem of the linearized operator associated with a traveling wave solution of reaction-diffusion systems. In this research, we construct the Evans function that vanishes at eigenvalues and is analytic in a simply connected bounded domain in the complex plane. This research is a joint work with Ayuki Sekisaka of Meiji University.

概要 We are concerned with a Neumann problem of a shadow system of the Gierer-Meinhardt model in an interval I=(0,1). A stationary problem is studied, and we consider the diffusion coefficient $\varepsilon>0$ as a bifurcation parameter. Then a complete bifurcation diagram of the stationary solutions is obtained, and a stability of every stationary solution is determined. In particular, for each $n\geq 1$, two branches of n-mode solutions emanate from a trivial branch. All 1-mode solutions are stable for small $\tau>0$, and all n-mode solutions, $n\geq 2$, are unstable for all $\tau>0$, where $\tau>0$ is a time constant. The system is known for having stationary spiky patterns with large amplitude for small $\varepsilon>0$. Then, asymptotic expansions of maximum and minimum values of a stationary solution as $\varepsilon\to 0$ are also obtained.

概要 We discuss the spreading dynamics for a three-species predator-prey system with two weak competing predators and one prey in a shifting habitat. First, we explain some extinction results for each species. Then we provide some persistence theorems for each species with moving speeds exceeding the shifting speed, but less than certain quantities. Finally, the convergence to a certain constant state is proven in each persistent regime.

22 熊 谷 健 太 (東 工 大 理) 二次元における優臨界半線形楕円型方程式の分岐構造 · · · · · · · · · · · · 12 Kenta Kumagai (Tokyo Tech) Bifurcation structure of supercritical semilinear elliptic equations in two dimensions

概要 We consider the Gelfand problem with general supercritical nonlinearities in the two-dimensional unit ball. In this talk, we prove the uniqueness of solutions for any small parameter. As a result, we obtain the existence of a radial singular solution. Moreover, we prove the uniformly boundedness of finite Morse index solutions. As a consequence, we show that the bifurcation curve has infinitely many turning points. These properties are known in N dimensions with $3 \le N \le 9$ for general supercritical nonlinearities. On the other hand, these properties are less known in two dimensions. Our results clarify that the bifurcation structure solely depends on the supercriticality/subcriticality of the nonlinearities.

概要 We study the global bifurcation diagram of positive solutions to the semilinear elliptic equation $\Delta u + \lambda f(u) = 0$. Under general supercritical growth conditions on f(u), we show that an unbounded bifurcation curve has no turning point, which indicates the existence of the singular extremal solution. In particular, our theory can be applied to the super-exponential cases of f(u), and we exhibit that the bifurcation curve has the same qualitative property as a classical Gel'fand problem for $N \geq 3$ except N = 10.

中野 史彦(東北 大理) ランダムシュレーディンガー作用素の準位統計とランダムウォーク

Fumihiko Nakano (Tohoku Univ.) Statistics for random Schroedinger operators and random walk

概要 Disordered quantum systems is one of the fundamental topics in mathematical physics. It is the origin of various important phenomena, such as Anderson localization, quantum Hall effect and topological insulators. A typical feature in its spectral property is the appearance of dense point spectrum and exponential decay of corresponding eigenfunctions. Recently, much attention is being paid for its statistical property, which is believed to reflect the structure of these systems.

In this talk, I will review results on the eigenvalue statistics problem for the following Hamiltonians, through which one can see how the statistics is inked to spectral property and then its essential features.

- (i) 1-dimensional model with decaying potentials: it has phase transition depending on the decay rate. Many results have been obtained, including eigenfunction statistics.
- (ii) d-dimensional model with decaying potentials : much less is known than (i), but it has another type of phase transition.
- (iii) 1-dimensional dimer model: it typically has critical energy where the Lyapunov exponent vanishes, on which it has strange statistical behavior, except which we have usual Poisson statistics.
- (iv) 1-dimensional model related to vertex reinforced jumped process (ongoing work) : spectral property is linked to the recurrence of this RW.

exponential nonlinearity

概要 In this talk, we will deal with the nonlinear Schrödinger equation (NLS) in which the nonlinear term is an exponential function. (NLS) has a solution called a scattering solution when the dispersion is more dominant than the nonlinearity of the equation. When doing this analysis, we generally consider a small solution and decompose it into a solitary wave component and a dispersive wave component, and as time passes, the solitary wave component converges to a fixed solitary wave, and the dispersive component converges more strongly to a linear solution. It is necessary to show that In the presentation, we will present the perturbation theory used for the proof.

Sho Katayama (Univ. of Tokyo) Existence and multiplicity of solutions to non-homoegeneous Dirichlet problems for the Lane–Emden equation

概要 This talk concerns a structure of positive solutions to the (not necessarily subcritical) Lane-Emden equation $-\Delta u = u^p$ in the half-space \mathbb{R}^N_+ with the non-homogeneous Dirichlet boundary condition $u = \kappa \mu$ on $\partial \mathbb{R}^N_+$. Under suitable conditions on the exponent p and a nonnegative continuous boundary data μ , we give a complete classification of the existence/nonexistence of positive solutions with respect to the value of parameter $\kappa > 0$. We also give a result on the multiple existence of solutions via bifurcation theory. The most important aspect of this result is a new-type condition for the exponent p, which reflects the structure of the half-space.

Satoshi Tanaka (Tohoku Univ.)

函数方程式論 26 田中 敏 (東 北 大 理) b Existence of positive solutions to an eigenvalue problem with a variable Satoshi Tanaka (Tohoku Univ.) Existence of positive solutions to an eigenvalue problem with a variable exponent

概要 The problem $-\Delta_{p(|x|)}u - \Delta_q u = \lambda(|u|^{p(|x|)-2}u + |u|^{q-2}u)$ in B; u = 0 on ∂B is considered, where $B = \{x \in \mathbb{R}^N : |x| < R\}, \ N \ge 1, \ \Delta_{p(|x|)}u = \operatorname{div}(|\nabla u|^{p(|x|)-2}\nabla u), \ p(r) \text{ is continuous and satisfies } p(r) > 1 \text{ on } r \ge 1, \ \Delta_{p(|x|)}u = \operatorname{div}(|\nabla u|^{p(|x|)-2}\nabla u), \ p(r) = 1, \ n \ge 1, \ n \ge$ $[0,R], \Delta_q u = \operatorname{div}(|\nabla u|^{q-2}\nabla u), \text{ and } q > 1.$ The existence of positive solutions is proved for every $\lambda > \lambda_1(q),$ where $\lambda_1(q)$ is the first eigenvalue of q-Laplacian.

27 田中視英子(東京理大理) Remarks on non-local eigenvalue problems for the p-Laplacian · · · · · · 12 Mieko Tanaka (Tokyo Univ. of Sci.) Remarks on non-local eigenvalue problems for the p-Laplacian

概要 We consider the p-Laplace eigenvalue problem having a nonlocal term under the zero Dirichlet boundary condition. In particular, we show the existence of the least eigenvalue μ_q^w such that the equation has a nodal solution. We prove that this eigenvalue μ_q^w coincides with the second one in the p-sublinear case q < p provided $w \ge 0$ a.e. in Ω .

 Stability of metric viscosity solutions under Hausdorff convergence
 - 概要 We establish a stability result for viscosity solutions of Hamilton—Jacobi equations for a sequence of domains converging in the Hausdorff sense. A background of this study is domain perturbation problems for Hamilton—Jacobi equations. In this talk we introduce the idea of proving the stability of viscosity solutions, starting with the definition of metric viscosity solutions. A key to the proof is a characterization of the metric viscosity solutions by the squared distance functions.
- E. Zhanpeisov
柳(沖縄科学技術大)Liouville-type theorems for fully nonlinear elliptic and parabolic equations with boundary degeneracy12Erbol Zhanpeisov
(Okinawa Inst. of Sci. and Tech. Grad. Univ.)Liouville-type theorems for fully nonlinear elliptic and parabolic equations with boundary degeneracyQing Liu
(Okinawa Inst. of Sci. and Tech. Grad. Univ.)tions with boundary degeneracy

概要 We study a general class of fully nonlinear boundary-degenerate elliptic or parabolic equations that admit a trivial solution. Although no boundary conditions are posed together with the equations, we show that the operator degeneracy actually generates an implicit boundary condition. Under appropriate assumptions on the degeneracy rate and regularity of the operator, we then prove that there exist no bounded solutions other than the trivial one. Our method is based on the arguments for uniqueness of viscosity solutions to state constraint problems for Hamilton–Jacobi equations. Several concrete examples of the equations that satisfy the assumptions are also given.

Tokuhiro Eto (Univ. of Tokyo) A convergence result for a minimizing movement scheme for mean cur-Yoshikazu Giga (Univ. of Tokyo) vature flow with prescribed contact angle in a curved domain

概要 We consider a minimizing movement scheme of Chambolle type for the mean curvature flow equation with prescribed contact angle condition in a smooth bounded domain in \mathbb{R}^d ($d \geq 2$). We prove that an approximate solution constructed by the proposed scheme converges to the level-set mean curvature flow with prescribed contact angle provided that the domain is convex and that the contact angle is away from zero under some control of derivatives of given prescribed angle. We actually prove that an auxiliary function corresponding to the scheme uniformly converges to a unique viscosity solution to the level-set equation with an oblique derivative boundary condition corresponding to the prescribed boundary condition.

田中視英子 (東京理大理) Eigenvalue problems for (p,q)-Laplace equations with two parameters Mieko Tanaka (Tokyo Univ. of Sci.) Eigenvalue problems for (p,q)-Laplace equations with two parameters

概要 We consider generalized eigenvalue problems for (p,q)-Laplacian with two parameters under the Dirichlet boundary condition. The equations we are dealing with consist of two eigenvalue problems for p-Laplacian and q-Laplacian, which were introduced by myself and Bobkov. We have considered the classification of parameters such that the equation has positive solutions or sign change solutions in response to the first or second eigenvalue problem. This talk is based on the results of joint research works with Vladimir Bobkov that have been in progress for the last nine years.

	概要 We consider the long-time asymptotic behavior of solutions to a nonlinear Fokker-Planck model, including the porous medium-type nonlinear diffusion and inhomogeneous spatial diffusion subjected to the Neumann boundary condition. The model is based on the continuity equation and the energy law regarding some free energy. By assuming the diffusion coefficient is sufficiently large, we show the exponential decay of the first derivative of the free energy, which is called the dissipation in terms of the free energy. To prove the main result, we extend the entropy dissipation method to the Fokker-Planck equation with the inhomogeneous spatial diffusion coefficient.

	概要 We consider the long-time behavior of solutions to non-linear Fokker-Planck equations with inhomogeneous diffusion. Based on the energy law with variable coefficients and the continuity equation, we obtain a non-linear partial differential equation related to stochastic differential equations. The entropy dissipation method is a well-known way to study the long-time behavior of the solution to the Fokker-Planck equations. We extend the entropy dissipation methods and show the exponential decay of the free energy's dissipation term concerning the non-linear Fokker-Planck equation when the diffusion coefficient is large enough.
44	佐久間正樹(東大数理) 一般化された畳み込み核をもつ臨界分数階 Choquard 型方程式の解の無

概要 We discuss the existence of infinite sequences of solutions to Choquard-type equations involving the fractional Laplacian and generalized nonlocal nonlinearities with critical growth. We utilize a generalized version of the concentration compactness method that can be directly applied to nonlocal quantities involving convolution with weak L^p -functions in order to assure the compactness of $(PS)_c$ sequences. We guarantee the existence of a sequence of weak solutions corresponding to critical values converging to zero by a critical point theorem based on the concept of Krasnoselskii genus, which is useful in variational methods.

Existence of infinite sequences of solutions to some critical fractional

Local existence and nonexistence for fractional in time reaction-diffusion equations and systems with rapidly growing nonlinear terms · · · · · · · 12

Masamitsu Suzuki (Meiji Univ.)

Local existence and nonexistence for fractional in time reaction-diffusion equations and systems with rapidly growing nonlinear terms

概要 We study the fractional in time reaction-diffusion equation

$$\begin{cases} \partial_t^{\alpha} u = \Delta u + f(u) & \text{in } \mathbb{R}^N \times (0, T), \\ u(x, 0) = u_0(x) & \text{in } \mathbb{R}^N, \end{cases}$$

where $0 < \alpha < 1$, $N \ge 1$, T > 0 and $u_0 \ge 0$. The fractional derivative ∂_t^{α} is meant in a generalized Caputo sense. We mainly consider the case where f has an exponential or a superexponential growth, and u_0 has a singularity. We obtain integrability conditions on u_0 which explicitly determine local in time existence/nonexistence of a nonnegative mild solution. Moreover, our analysis can be applied to time fractional systems.

On Fujita critical time-fractional semilinear heat equations in uniformly local weak Zygmund spaces

概要 In this talk, we consider the time-fractional semilinear heat equation with the critical exponent, in uniformly local weak Zygmund spaces. We obtain a sufficient condition for the local-in-time solvability, which does not vanish when the order of the derivative with respect to time goes to one. Through our arguments, we see that the solvability of the time-fractional problem connects to the usual one in a natural way.

Thin-film limit of the Ginzburg–Landau heat flow in a curved thin domain

概要 We consider the Ginzburg-Landau heat flow in a curved thin domain under the Naumann boundary condition. When the curved thin domain shrinks to a given closed hypersurface as the thickness of the thin domain tends to zero, we show that the weighted average of a weak solution to the thin-domain problem converges weakly on the limit surface under the assumption that the initial data is in L^{∞} . Moreover, we derive a limit equation on the limit surface by characterizing the limit function as a weak solution to the limit equation.

Curve diffusion flow with the boundary on two skew lines

Fuya Hiroi (Tohoku Univ.) Shinya Okabe (Tohoku Univ.)

概要 We consider curve diffusion flow for planar open curves with the boundary on two skew lines crossing at the origin with the angle $\theta \in (0, \pi)$. In 2022 Wheeler–Wheeler considered curve diffusion flow for planar open curves with the boundary on two parallel lines and they proved global in time solvability of the problem and exponential convergence of the solution to the line segment. In this talk, we will give a suitable extension of the result of Wheeler–Wheeler to the case of curves with the boundary on two skew lines.

57 函数方程式論

Tatsuya Miura (Kyoto Univ.) Stability of pinned planar p-elasticae Kensuke Yoshizawa (Nagasaki Univ.)

概要 In this talk we consider stability of critical points of the p-bending energy among open planar curves pinned at the endpoints. By a geometric approach, we obtain optimal necessary conditions for stable critical points, and it leads to uniqueness of stable pinned p-elasticae for $p \in (1, 2]$. Our proof is based on a simple but robust 'cut-and-paste' trick without computing the energy nor its second variation.

Aya Ishizeki (Saitama Univ.) Möbius energies for multi-component-links, and their Möbius-invariant Takeyuki Nagasawa (Saitama Univ.) decomposition

概要 Möbius-invariant energy for multi-component links was proposed by Freedman–He–Wang. A new energy is proposed here, and demonstrated its Möbius-invariance. When the number of components is 2, both energies are the same. If this number exceeds 2, the energy becomes independent of Freedman–He–Wang's energy. In the previous study, the present authors showed that the energy for 2-component links can be decomposed into two Möbius-invariant energies. In this study, the decomposition of the new energy is demonstrated for m-component. This is decomposed into $2^{\frac{m(m-1)}{2}}$ Möbius-invariant energies.

52 星 屋 陽 俊 (東 大 数 理) Orthonormal Strichartz estimate for Schrödinger operator · · · · · · · · 10
Akitoshi Hoshiya (Univ. of Tokyo) Orthonormal Strichartz estimate for Schrödinger operator

概要 We consider the orthonormal Strichartz estimate for Schrödinger operator, which is a generalization of the ordinary Strichartz estimate. Under some assumptions on potentials, we prove the estimate for the same exponent as the free Hamiltonian. Our proof is based on the smooth perturbation theory by T. Kato. We also discuss some applications to nonlinear Schrödinger equations.

	Antoine Borie	(Univ. of Rennes)	infinite quantum systems
	Julien Sabin	(Univ. of Rennes)	

概要 In this talk, we consider the Hartree equation describing infinite quantum systems. It has infinitely many stationary solutions, and we are interested in their asymptotic stability. This problem is an analogy of the nonlinear Landau damping on the quantum side. In the known results, we need strong assumptions for both interactions and stationary solutions when $d \ge 4$. In this talk, we weaken the assumptions for both of them. There are two main difficulties: (1) How to get estimates with fractional derivatives, and (2) We cannot use Christ-Kiselev lemma. We will discuss these difficulties and how to overcome them. This talk is based on the joint work with Antoine Borie (University of Rennes) and Julien Sabin (University of Rennes).

戍 亥 隆 恭(阪 大 理)	Global dynamics of threshold solutions for the nonlinear Schrödinger
		equation with repulsive Dirac delta potential
Takahisa Inui	(Osaka Univ.)	Global dynamics of threshold solutions for the nonlinear Schrödinger
		equation with repulsive Dirac delta potential

概要 We consider the L^2 -supercritical nonlinear Schrödinger equation with a repulsive Dirac delta potential in one-dimensional space. A previous work clarified the global dynamics of solutions below a threshold. For general solutions, the threshold is given by a moving one-soliton. On the other hand, roughly speaking, that for even solutions is given by the ground state of the equation. Moreover, a sequent work showed that in the general setting the solutions at the threshold scatter or blow up. In this talk, we mainly consider the global dynamic of the even solutions at its threshold. Precisely speaking, the threshold has two regions; one is given by the ground state as stated above, and the other is given by a moving two-soliton. In the former case, we have five scenarios: scattering solutions, blow-up ones, ground states, and asymptotic solutions to the ground state (which scatter or blow up in the opposite time direction). In the latter case, there are only two scenarios: scattering or blow-up. This talk is based on joint works with Prof. Gustafson in the University of British Columbia.

	Gastón Vergara-Hermosilla	
	(Univ. Paris-Saclay)	

概要 We consider barotropic Navier-Stokes equations in a 1D channel $[0, \pi]$ with homogeneous Dirichlet boundary conditions at the ends. Given sufficiently close subintervals $I = [\alpha_1, \alpha_2]$ and $J = [\beta_1, \beta_2]$, we show that there exists an external force on the momentum equation such that the associated flow maps I to J in any given time T > 0. We show this by finding two external forces that have independent stretching effects on the interval I, then applying the inverse function theorem. That there exist such external forces is proved as a consequence of a unique continuation property which we prove using Fourier analytic techniques.

Naoto Deguchi (Tokyo Tech) Low Mach number limit of the compressible Navier-Stokes equation
with stationary force

概要 We are concerned with the low Mach number limit of the compressible Navier—Stokes equation with stationary external force in the 3D whole space. It is known that if the external force decays in time, then the compressible Navier—Stokes flows converge to the corresponding incompressible Navier—Stokes flow when the Mach number goes to zero. We derive the low Mach number limit of the compressible Navier—Stokes equation when the external force is stationary and small enough.

14:15~16:45

概要 The Keller–Segel–Navier–Stokes system in a bounded smooth domain $\Omega \subset \mathbb{R}^N$ $(N \geq 2)$ is considered, where the cell density n satisfies nonlinear boundary conditions due to the tensor-valued chemotactic sensitivity function S. The aim of this talk is to construct a unique global strong solution of the system by applying suitable maximal regularity theorems. In particular, to this end we establish a new maximal regularity theorem for some linear heat equation with an inhomogeneous Neumann boundary condition.

概要 In this talk, we consider the primitive equations on non-flat layers. We first define the hydrostatic Stokes projection operator on non-flat layers, and we prove the maximal L^q -regularity of the corresponding linearized equation via H^{∞} -calculus. At the next step, in order to extend the local solution to the global one, we establish an energy estimate in the framework of L^2 -space.

Analyticity and asymptotic behavior of solutions to the Navier-Stokes equations in critical Fourier-Herz spaces 概要 We consider the initial value problem of the incompressible Navier-Stokes equations (NS) in the whole space \mathbb{R}^d $(d \geq 2)$. Starting with the pioneering work by Fujita–Kato (1964), many researchers have studied the well-posedness of this problem (NS) in scaling critical spaces. In this talk, we focus on the endpoint critical spaces which guarantees the global well-posedness of the problem (NS). In such an end-point framework, we newly establish the Foias-Temam type analyticity and Fujigaki-Miyakawa type asymptotic expansion of mild solutions to the problem (NS). 小 薗 英 雄(早 大 理 工) Asymptotic behavior of solutions to elliptic equations in 2D exterior domains 10 寺 澤 祐 高(名大多元数理) 若 杉 勇 太 (広島大先進理工) Hideo Kozono (Waseda Univ.) Asymptotic behavior of solutions to elliptic equations in 2D exterior Yutaka Terasawa (Nagoya Univ.) domains Yuta Wakasugi (Hiroshima Univ.) 概要 The asymptotic behavior of solutions to the second order elliptic equations in exterior domains is studied. In particular, under the assumption that the solution belongs to the Lorentz space $L^{p,q}$ or the weak Lebesgue space $L^{p,\infty}$ with certain conditions on the coefficients, we give natural and an almost sharp pointwise estimate of the solution at spacial infinity. 密度が一様でない非圧縮性粘性流体の2相問題の時間大域的可解性につ 大石健太(香川高専) 齋 藤 平 和 (電通大情報理工) Kenta Oishi Global solvability of the two-phase problem of inhomogeneous incom-(Kagawa Nat. Coll. of Tech.) pressible viscous fluids Hirokazu Saito (Univ. of Electro-Comm.)

概要 We develop the global solvability for a two-phase free boundary problem describing the motion of the inhomogeneous incompressible viscous fluids in \mathbb{R}^N with $N \geq 3$. The fluids are separated from one another by a sharp interface, which is close to the hyperplane $x_N = 0$. The proof is based on the maximal regularity for a linearized problem and the time decay estimate of Stokes semigroup established by Saito. We also introduce a norm of solutions simpler than that employed in the study due to Oishi and Shibata on the one-phase flows of homogeneous incompressible fluids in a half-space-like domain.

概要 In this talk, we study a linear theory to deal with the time periodic problem for the Navier-Stokes equations on unbounded domains with moving boundary. Compared to the case of bounded domains the underlying modified time-dependent Stokes operators are no longer invertible, thus leading to a more sophisticated construction of the evolution operator. Moreover, Sobolev embeddings on L^q spaces imply restrictions on q depending on geometric properties of the domain. The theory is focusing on the half space case, the construction and local-in-time estimates of the evolution operator and its adjoint in view of time periodic solutions.

概要 Consider the three-dimensional Navier-Stokes flow past a moving rigid body $\mathcal{O} \subset \mathbb{R}^3$ with prescribed translational and angular velocities, where \mathcal{O} stands for a bounded Lipschitz domain. We prove that the solution to the linearized problem is governed by a C_0 -semigroup on solenoidal L^q -vector spaces with the L^q - L^r estimates provided that $|1/q - 1/2| < 1/6 + \varepsilon$ with some $\varepsilon > 0$. As an application, we prove the existence and uniqueness of mild solutions to the Navier-Stokes problem when the translational and angular velocities and the initial are sufficiently small.

17:00~18:00 特別講演

ブレジナヤン (九 太 基 幹) Long-time behavior of the dissipative compressible MHD Jan Brezina (Kyushu Univ.) Long-time behavior of the dissipative compressible MHD

概要 Dissipative systems are thermodynamically open systems often in the out of equilibrium regime. They are examples of the most interesting real world phenomena developing patterns, structures, or behaviours that they did not have when first formed. The dissipative systems exchange energy and matter with their environment, while dissipating mechanical and other forms of energy in accordance with the Second law of thermodynamics. In continuum fluid mechanics, a family of field equations accompanied with *inhomogeneous* boundary conditions are often used to model dissipative systems.

Many spectacular events occurring in geophysics or astrophysics, among which the dynamics of the solar convection zone, are attributed to the action of the magnetic field. As direct measurements and data collecting are often hampered by obvious technical limitations, reliable mathematical models are indispensable for understanding the observed phenomena. As pointed out by Gough, a correct choice of boundary conditions plays a crucial role.

In this talk we discuss the long time behavior of the complete system of equations governing the motion of a general compressible, viscous, electrically and heat conductive fluid driven by non-conservative boundary conditions. That is, the time evolution of the solutions to a dissipative *compressible magnetohydrodynamics*.

Smoothing estimate for the heat semigroup with a homogeneous weight

Hardy–Hénon parabolic equation on Morrey spaces.

 $14:15\sim16:45$

概要 The boundedness (continuity) of composition operators from some function space to another one is significant, though there are few results about this problem. Thus, in this study, we provide necessary and sufficient conditions on the boundedness of composition operators from Lorentz spaces to Orlicz spaces. We emphasize that the measure spaces associated with the Lorentz space may be different from those associated with the Orlicz spaces. Moreover we give some examples and counterexamples of the composed mappings in the conditions.

概要 Let us consider the logarithmic inequalities of Brezis-Gallouet-Wainger type in Triebel-Lizorkin spaces and Triebel-Lizorkin-Morrey spaces. We obtain the inequalities

$$||f||_{L_{\infty}} \lesssim_{n,p,r,s} 1 + ||f||_{\dot{F}_{r,\infty}^{n/r}} \left(\log^{+}(||f||_{L_{p}} + ||f||_{\dot{C}^{s}})\right)^{1-\frac{1}{r}}$$

for $1 \le p < \infty$, $1 < r \le \infty$, s > 0, and

$$||f||_{B_{\infty,1}^0} \lesssim_{n,p,q,r,r_1,s} 1 + ||f||_{\dot{\mathcal{E}}_r^{n/r}} \log^+ ||f||_{\mathcal{E}_{p,q,\infty}^u}$$

for $0 < q \le p < \infty$, $1 \le r_1 \le r < \infty$, $n/p < u < \infty$. These inequalities improve the results obtained by Kozono–Wadade (2008) and Sawano–Wadade (2013) respectively.

概要 The purpose of this talk is to investigate the behavior of the Riesz potential on several functions spaces containing Choquet and Choquet-Morrey spaces. To clearly describe the connection between Morrey spaces and Hausdorff capacities, Riesz potentials will be placed at the center of the discussion. In the first half of this talk, we will review some elementary facts about Hausdorff capacities and maximal theorems, and introduce its applications to PDEs. In the latter half, several recent works by other authors, as well as the author's results based on joint work with Hatano, Kawasumi, and Professor Tanaka, will be discussed.

<u>Hana Kakiuchi</u> (Japan Women's Univ.) On existence of solutions to free boundary problems representing the Toyohiko Aiki (Japan Women's Univ.) baking process

概要 In this talk we establish existence of solutions to the one-dimensional free boundary problem describing a baking process of bread. For the problem we assume that a region occupied by the breads consists of crumb, crust and the evaporation front, and unknown functions are the position of the evaporation front, the temperature field and the mass distribution. By the difficulty of the boundary condition, we have considered only the approximation problem. Now, we aim to show existence of solutions to the original problem by applying the weak formulation.

Naotaka Ukai (Chiba Univ.) Uniqueness for gray-scale imege-denoising process with anisotropic ori-Daiki Mizuno (Chiba Univ.) entation adjustment Ken Shirakawa (Chiba Univ.)

概要 In this talk, we consider a gradient system of a non-convex functional, based on a governing energy for anisotropic image denoising, developed in [Berkels et al., SFB 611, 2006]. A characteristic of our gradient system lies in the nonstandard part, which consists of the (set-valued) subdifferential of an anisotropic norm denoted by γ , and a two dimensional rotation matrix denoted by R. These play a key role in the orientation adjustment within the image denoising process. Under appropriate settings, we will provide the construction of an energy gradient system where the uniqueness of the solution is guaranteed in both the continuous system and the discrete approximation scheme.

概要 In this talk, we deal with a parabolic system to represent planar grain boundary motion, known as KWC-type system, proposed by [Kobayashi et al., Physica D, 140, 141–150(2000)]. In this system, the difficulties lie in singular diffusion of the second equation of the system, and unknown-dependent mobilities of grain boundary motion, which cause many challenges especially in the uniqueness. To address these, previous works have proposed specific settings on the spatial dimension, or certain adjustments on the mobility. In this light, we here discuss the pseudo-parabolic type regularity for solutions to our parabolic system. Consequently, we will obtain some positive answer for the uniqueness question, which has been one of open problems in the studies of KWC system.

	Shun Uchida (Oita Univ.)	
	Takeshi Fukao (Ryukoku Univ.)	

概要 In this talk, we consider some optimal control problem of an ODE governed by the hypaergraph Laplacian. Since the hypaergraph Laplacian is a set-valued operator, it seems to be difficult to derive the necessary optimality condition for this problem. To cope with this difficulty, we introduce an approximation problem and assure the optimality condition for this. We also discuss the convergence of the condition to that for the original problem.

概要 In this talk, we consider a one-dimensional free boundary problem. This problem is a model describing micro-swelling in pores of porous materials. Here, let the porous materials and each pore be the macro domain and the micro domain, respectively, and we assume that each pore exists at the point of the materials. Under this assumption, we define a model describing micro-swelling at each pore. For this problem, we have already proved the existence and uniqueness of a solution to the model. In this talk, as a regularity of the solution in the micro domain, we discuss the differentiability of the solution with respect to macro variables and its applications.

k system, in a uniformly convex Banach space. Under appropriate assumptions, we establish the abstract result on the existence of solutions to our problem by applying the abstract theory of the time-derivative operators and the fixed-point theorem of Schauder type.

吉 住 拓 真 (阪 大 情 28 Global solutions for semi-linear Klein-Gordon equations in FLRW space-中村 誠(阪大情報) Takuma Yoshizumi (Osaka Univ.) Global solutions for semi-linear Klein-Gordon equations in FLRW space-Makoto Nakamura (Osaka Univ.) times

概要 We consider the Cauchy problem of semi-linear Klein-Gordon equations in Friedmann-Lemaítre-Robertson-Walker spacetimes. In this talk, we consider a concrete scale-function $a(\cdot)$, which describes various types of spaces as the expanding space, the blowing-up space (the "Big-Rip" in cosmology), the contracting space and the vanishing space (the "Big-Crunch" in cosmology). We proved global solutions for any initial data under some conditions on semi-linear terms, and global solutions for small initial data. The proofs are based on the contraction argument.

吉住拓真(阪大情報) Blowing-up solutions for semi-linear Klein–Gordon equations in FLRW 誠(阪大情報) Takuma Yoshizumi (Osaka Univ.) Blowing-up solutions for semi-linear Klein-Gordon equations in FLRW Makoto Nakamura (Osaka Univ.) spacetimes

概要 We consider the Cauchy problem of semi-linear Klein-Gordon equations in Friedmann-Lemaítre-Robertson-Walker spacetimes. In this talk, we consider a concrete scale-function $a(\cdot)$, which describes various types of spaces as the expanding space, the blowing-up space (the "Big-Rip" in cosmology), the contracting space and the vanishing space (the "Big-Crunch" in cosmology). For these equations, we have proved the blowing-up solutions for the gauge invariant semi-linear term and the gauge variant one.

喜多航佑(東北大理) On nonlinear heat equations with nonlinear boundary conditions in a bounded domain

Kosuke Kita (Tohoku Univ.) On nonlinear heat equations with nonlinear boundary conditions in a bounded domain

概要 In this talk, we are mainly concerned with the existence and nonexistence of global solutions to nonlinear heat equations with nonlinear boundary conditions in a bounded domain. In the case of the whole space, it is well known that the Fujita critical exponent is the threshold of the existence of nonnegative global solutions to nonlinear heat equations with a power-type nonlinearity. On the other hand, in the case of a bounded domain, we show that the existence and nonexistence of global nonnegative solutions to nonlinear heat equations of the Fujita type are characterized by not exponents but boundary conditions. Moreover, we also discuss a new comparison theorem for parabolic equations with nonlinear boundary conditions, which is the key to its proof.

	Shuji Watanabe (Gunma Univ.)	The Bogoliubov transformation and the gap equation in the BCS model of superconductivity with external magnetic field II

概要 We deal with a type I superconductor in a constant external magnetic field and the BCS-Bogoliubov gap equation with external magnetic field. We show that there is a unique magnetic field (the critical magnetic field) given by a smooth function of the temperature and that there is also a unique nonnegative solution (the gap function) given by a smooth function of both the temperature and the external magnetic field. We then show that the transition from the normal state to the superconducting state in a type I superconductor is a first-order phase transition. Moreover, we obtain the explicit expression for the gap in the entropy.

75 函数解析学

概要 We show the analyticity of the ground state of the pair interaction model. Previously, we directly estimated the radius of convergence, but constructing the analytic continuation in the abstract setting improves the prospect of the proof.

Fumio Hiroshima (Kyushu Univ.) Exponential decay of the ground state of the renormalized Nelson Hamiltonian by Agmon type metric

概要 Lower bound of the spatial decay of the ground state of the renormalized Nelson Hamiltonian with a continuous and confining potential V is considered. The ground state of the renormalized Nelson Hamiltonian is a boson Fock space -valued L2 function. The boson Fock space norm of the ground state is estimated from below by Agmon type distance.

Fumio Hiroshima (Kyushu Univ.) On the ergodicity of renormalized translation-invariant Nelson-type semigroups

概要 We present a simple functional integration based proof that the semigroups generated by the ultraviolet-renormalized translation-invariant non- and semi-relativistic Nelson Hamiltonians is positivity improving (and hence ergodic) with respect to the Froehlich cone for arbitrary values of the total momentum. Our argument significantly simplifies known proofs for ergodicity. In the semi-relativistic case the result is new for non-zero total momentum.

熊 ノ 郷 直 人 トーラス上の相空間 Feynman 経路積分 —経路空間上の解析として (工学院大教育推進機構)

Naoto Kumanogo (Kogakuin Univ.) Phase space Feynman path integrals on the torus —An analysis on path space

概要 We present two general sets of functionals for which phase space Feynman path integrals on the torus have a mathematically rigorous meaning. For each functional in each set, the time slicing approximation of the phase space path integral converges uniformly on compact subsets with respect to the ending point of position paths and to the starting point of momentum paths. Each set of functionals is closed under addition, multiplication, translation of paths, linear transformation of paths by invertible integer matrices, and functional differentiation. Therefore, we can construct a large number of path-integrable functionals. While caution must be exercised when using phase space path integrals, several properties analogous to those of conventional integrals are valid in the phase space path integral.

Koichi Arashi (Tokyo Gakugei Univ.) Multiplicitiy-free representations of nilpotent Lie groups over a quasisymmetric domain

概要 We investigate the multiplicity-freeness property of a representation of an affine transformation group on a Siegel domain of the second kind. A necessary and sufficient condition for the representation to be multiplicity-free is given. We relate the multiplicity-freeness property to the coisotropicity and the visibility of the group action.

概要 In 1990's, Dan Voiculescu introduced the notion of entropy and Fisher's information measure in free probability theory. Related to this study, he studied a certain non-commutative differential operator, which is called the cyclic derivative (associated with the free difference quotient). In 2020, Voiculescu studied the Euler equation in free probabilistic setting (the free Euler equation). In the free Euler equation, the cyclic derivative and its orthogonal complement play roles of gradient and divergence-free vector field (free divergence-free vector field), respectively. In this talk, I would like to introduce the structure of free divergence-free vector fields with respect to a free semi-circular system. This talk is based on the joint work with Akihiro Miyagawa (UCSD).

田 森 宥 好 Strichartz estimates for the (k,a)-generalized Laguerre operator (芝浦エ大システム理工)

Hiroyoshi Tamori Strichartz estimates for the (k, a)-generalized Laguerre operator (Shibaura Inst. of Tech.)

概要 The (k, a)-generalized Laguerre semigroup was introduced by Ben Said-Kobayashi-Orsted as an interpolation of the Hermite semigroup (the k = 0, a = 2 case) and the Laguerre semigroup (the k = 0, a = 1 case) from the viewpoint of unitary representations of the universal cover of $SL(2, \mathbb{R})$. Based on a joint work with Kouichi Taira (Kyushu University), I will explain an integral expression of the semigroup and an upper estimate of the integral kernel. As applications, under some conditions on the deformation parameter (k, a), an explicit formula of the integral kernel and Strichartz estimates for the (k, a)-generalized Laguerre operator $(-|x|^{2-a}\Delta_k + |x|^a)/a$ (Δ_k denotes the Dunkl Laplacian) are obtained.

概要 In this talk, we first prove the existence of strong solution for (time inhomogeneous) non-colliding particle systems. The idea of the proof is to use some Lyapunov function. We also consider numerical schemes for these stochastic processes and provide their rate of convergence.

4 笹 谷 晃 平 (東 大 数 理) 強局所な p-エネルギーに付随する p-エネルギー測度の構成 · · · · · · · 15 Kôhei Sasaya (Univ. of Tokyo) Construction of p-energy measures associated with strongly local p-energies 概要 A p-energy (E, F) on a metric space with a measure is an analog of a Dirichlet form in the L^p space.

Recently, this energy has been studied in order to considering "(1,p)-Sobolev space" on fractals. In this talk, we construct the p-energy measures associated with strongly local, regular p-energies (the equivalent of the energy measures associated with Dirichlet forms) without any assumptions of symmetry or self-similarity of the metric space. Moreover, with assuming separability of a quotient space of the domain \mathcal{F} induced by the seminorm $\mathcal{E}^{1/p}$, we prove that the non-symmetric form of the p-energy measures satisfy the chain rule and the Leibniz rule.

概要 In this talk, I will present our recent result on constructions of good p-energy forms on metric measure spaces as pointwise subsequential limits of Besov-type p-energy functionals. Such forms are often called Korevaar-Schoen p-energy forms in the literature. As an advantage of our approach, the resulting p-energy forms satisfy the strongly local property and a good contraction property called the generalized p-contraction property. In addition, similar to energy measures associated with a regular symmetric Dirichlet form, we obtain the associated p-energy measures through the Riesz-Markov-Kakutani representation theorem.

<u>Khanh Duy Trinh</u> (Waseda Univ.) Classical beta ensembles at high temperature and the Markov–Krein Fumihiko Nakano (Tohoku Univ.) relation

Hoang Dung Trinh

(VNU Univ. of Science)

概要 Three classical beta ensembles (Gaussian beta ensembles, beta Laguerre ensembles and beta Jacobi ensembles) are now realized as the eigenvalues of tridiagonal random matrices. In a high temperature regime, the regime where the parameter beta is proportional to the reciprocal of the system size, the empirical distribution of the eigenvalues converges weakly to a limiting measure which is related to associated Hermite / Laguerre / Jacobi polynomials. Moreover, the Gaussian (resp. gamma and beta) distribution and the limiting distribution in the Gaussian (resp. Laguerre and Jacobi) case satisfy the Markov-Krein relation. This talk will explain such relation by investigating the spectral measure of the tridiagonal random matrix model.

7 千 野 由 喜(NYCU) A characterization of symmetric environment for RWRE · · · · · · · · · 15
Yuki Chino (NYCU) A characterization of symmetric environment for RWRE

概要 Random walk in cooling random environment (RWCRE) is one of random walk in dynamical random environment models. RWCRE interpolates the modification from the classical random walk in random environment (RWRE). To characterize recurrence for RWCRE, we need to understand the balance between speed of dynamics and environment, especially for the case that environment is not symmetric. In this talk, we consider one characterization of symmetric environment for classical model. The talk is based on a joint work with Conrado da Costa (Durham University).

	Yushi Hamaguchi (Kyoto Univ.) A generalized coupling approach for the weak approximation of stochas- Dai Taguchi (Kansai Univ.) tic functional differential equations

概要 We are concerned with the weak approximation of the weak solutions of stochastic functional differential equations (SFDEs) by means of the Euler-Maruyama schemes. Under quite general assumptions on the coefficients, we provide an estimate for the Lévy-Prokhorov metric between the paths of the weak solution of the original SFDE and the corresponding scheme. The weak convergence rate in terms of the Lévy-Prokhorov metric is characterized by the probability of a "rare event" where the weak solution of the SFDE exits a large sub-domain, which can be easily estimated in many examples. The proof is based on the generalized coupling approach which has been studied in the field of ergodicity of infinite dimensional stochastic systems.

85 統計数学

概要 We theoretically analyze the original version of the denoising diffusion probabilistic models (DDPMs) presented in Ho, J., Jain, A., and Abbeel, P., Advances in Neural Information Processing Systems, 33 (2020), pp. 6840–6851. Our main theorem states that the sequence constructed by the original DDPM sampling algorithm weakly converges to a given data distribution as the number of time steps goes to infinity, under some asymptotic conditions on the parameters for the variance schedule, the L^2 -based score estimation error, and the noise estimating function with respect to the number of time steps. In proving the theorem, we reveal that the sampling sequence can be seen as an exponential integrator type approximation of a reverse time stochastic differential equation.

15 上 島 芳 倫 (東洋大情報連携) 長距離相互作用を持つ自己回避歩行に対する局所極限定理 · · · · · · · · 15 Yoshinori Kamijima (Toyo Univ.) A local limit theorem for the long-range self-avoiding walk

概要 The self-avoiding walk (SAW) is a model added self-avoidance interaction to the random walk. In other words, each path does not visit the same vertex on a graph more than once. It is known that the spread-out finite-range SAW enjoys the central limit theorem [van der Hofstad and Slade (2003) AAM]. Taking an average on a ball, they also proved a certain type of a local limit theorem. For the spread-out long-range SAW, the power-law decay of the two-point function was shown in [Chen and Sakai (2019) CMP]. In this talk, I will explain an attempt to prove a local limit theorem for the spread-out long-range SAW in the original sense. Our motivations come from combining the results of the previous researches. This is joint work with Lung-Chi Chen (National Chengchi University) and Yuki Chino (National Yang-Ming Chiao-Tung University).

概要 The quantum walk is a quantum counterpart of the classical random walk and the absolute zeta function can be considered as a zeta function over \mathbb{F}_1 . We showed a connection between the quantum walk and the absolute zeta function. Then we focused Grover walks on cycle graphs, which are typical models of quantum walks, and using cyclotomic polynomials, we calculated the periods and absolute zeta functions of such quantum walk with 3 states previously. In this talk, we report on the development of the method for 3 states and its application to 5 states or a general odd number of states.

概要 The allometric regression model is a multivariate multiple regression model imposing that the difference between expectation vectors of two observations with different values of explanatory variables is parallel to the first principal eigenvector. In this presentation, estimation of the first principal eigenvector in the allometric regression model is discussed. Considering a class of estimators based on a weighted matrix of the regression sum of square matrix and the residual sum of squares matrix, we propose a new estimator that purposes to decrement an upper bound of the mean squared error of an estimator contained in this class. The proposed estimator and some conventional estimators are numerically compared.

22 <u>河本旦平</u> (九大JGMI) 後藤佑一(九大数理) 佃康司(九大数理)	Spectral clustering algorithm for the allometric extension model	15
Kohei Kawamoto (Kyushu Univ.) Yuichi Goto (Kyushu Univ.) Koji Tsukuda (Kyushu Univ.)	Spectral clustering algorithm for the allometric extension model	

概要 The spectral clustering algorithm is used as a binary clustering method by applying the principal component analysis. Homoscedasticity of two clusters is commonly supposed in existing studies, but this restrictive assumption is often unrealistic in practice. Therefore, we consider the allometric extension model, that is, the directions of the first eigenvectors of two covariance matrices and the direction of the difference of two mean vectors coincide. A non-asymptotic bound of the error probability is provided for the spectral clustering.

概要 The recent seminal work of Chernozhukov, Chetverikov and Kato has shown that bootstrap approximation for the maximum of a sum of independent random vectors is justified even when the dimension is much larger than the sample size. In this context, numerical experiments suggest that third-moment match bootstrap approximations would outperform normal approximation even without studentization, but the existing theoretical results cannot explain this phenomenon. In this talk, we derive an asymptotic expansion formula of the bootstrap coverage probability and show that the third-moment match wild bootstrap is second-order accurate in high-dimensions even without studentization when the covariance matrix has identical diagonal entries and bounded eigenvalues.

Yozo Tonaki (Osaka Univ.) Parameter estimation for a linear parabolic SPDE in two space dimenyusuke Kaino (Kobe Univ.) sions
Masayuki Uchida (Osaka Univ.)

概要 We consider parameter estimation for a linear parabolic second-order stochastic partial differential equation (SPDE) in two space dimensions driven by a Q-Wiener process based on high-frequency data with respect to time and space. Applying the methodology of Hildebrandt and Trabs (2021,EJS) to the SPDE in two space dimensions, we obtain minimum contrast estimators (MCEs) of the coefficient parameters of the SPDE in two space dimensions based on temporal and spatial increments. Furthermore, we develop adaptive estimators of the coefficient parameters based on an approximate coordinate process. It is shown that the adaptive estimators have asymptotic normality under certain regularity conditions.

上原悠槙(関西大システム理工) Predictive model selection for jump diffusion models

Yuma Uehara (Kansai Univ.) Predictive model selection for jump diffusion models

概要 A model selection problem is considered for jump-diffusion models based on high-frequency samples. The terminal time is supposed to diverge (ergodic setting), and the interest is to select drift and diffusion coefficients and jump distribution among candidates. An explicit AIC-type information criterion is proposed based on the threshold quasi-likelihood. Unlike the diffusion case, when the jump term is parametrized in some way, the stochastic flow approach cannot be directly used to get the transition density estimates, which is essential to evaluate the bias. To validate such an approximation, new transition density estimates are presented.

仲 北 祥 悟(東大総合文化) 非スパース高次元統計理論における最近の展開

Shogo Nakakita (Univ. of Tokyo) Recent development in theories of non-sparse high-dimensional statistics

概要 We introduce two topics and our studies on them: (1) non-sparse high-dimensional linear regression problems and (2) non-sparse high-dimensional logistic regression problems. We first show a study on benign overfitting of linear regression under time series dependence. Benign overfitting is a phenomenon where over-parameterized statistical models can achieve small prediction errors even if they overfit training data. Whilst previous studies on this phenomenon are based on i.i.d. settings, we examine this phenomenon under temporal dependence. We observe that the coherence of autocorrelation matrices serves small prediction errors; such a phenomenon is not seen in under-parameterized regression under dependence. In the second place, we show a novel uniform concentration bound and a uniform law of large numbers of constrained logistic regression. Logistic models are fundamental in the binary classification problem in statistics and machine learning. Under high-dimensional settings, it is known that the maximum likelihood estimation (MLE) for logistic regression can be biased. We investigate when the MLE can perform well even under high-dimensional settings and see that an effective rank of the covariance matrix of inputs plays an important role.

Kento Egashira (Tokyo Univ. of Sci.) Modification to k-means for high-dimensional data Kazuyoshi Yata (Univ. of Tsukuba)
Makoto Aoshima (Univ. of Tsukuba)

概要 k-means has been approved as a useful methodology for analysing high-dimensional, low-sample-size data. There remains scope for research on the asymptotic properties of the k-means about high-dimensional data. In the k-means, an appropriate increase in the number of initial data can be expected to enhance performance. In this talk, we derive the asymptotic properties of this approach and conduct a comparison with the conventional k-means. Additionally, based on the asymptotic properties of the conventional k-means, a modified method is proposed and evaluated in comparison to the conventional k-means. At last, we present numerical simulation studies that demonstrate the performance of k-means for high dimensional data, discussing the achieved results.

27 野良彦(阪公大理) An adaptive singular value shrinkage for estimation problem of low-rank matrix mean with unknown covariance matrix 10 Yoshihiko Konno (Osaka Metro. Univ.) An adaptive singular value shrinkage for estimation problem of low-rank matrix mean with unknown covariance matrix 概要 Matrix models which are constructed from a deterministic signal plus noise are used in variety of fields. In particular it commonly happens that a signal matrix is of low-rank, however the rank itself is unknown. In this paper it is assumed that the noises are distributed as real normal or complex normal distributions, across columns are independently and identically distributed, and across rows of noise matrix are correlated. But the covariance matrix is unknown. For the problem of estimating a low-rank matrix, estimators with soft-thresholding singular values are considered and a formula to choose a threshold is proposed based on the SURE method. 若木宏文(広島大理) Complete bias modification of the risk of the model based on KL diver-柳原宏和(広島大理) Hirofumi Wakaki (Hiroshima Univ.) Complete bias modification of the risk of the model based on KL diver-Hirokazu Yanagihara (Hiroshima Univ.) gence 概要 Consider the estimation of a risk function based on the KL divergence for a variable selection problem in a linear regression model. Fujikoshi and Satoh (1997) proposed Modified AIC (MAIC) as an asymptotically unbiased estimator of this risk function. MAIC corrects for bias for the underspecified model that does not include the true model, but leaves bias in the overspecified model, which was completely corrected by Corrected AIC by Sugiura (1978). Therefore, this study proposes an unbiased estimator that can fully correct the bias for both overspecified and underspecified models. Numerical experiments are conducted to confirm its performance as an information criterion. 佐川凜 華(早大理工) An information criterion for detecting periodicities in functional time 29言(早 大 理 工) Rinka Sagawa (Waseda Univ.) An information criterion for detecting periodicities in functional time Yan Liu (Waseda Univ.) series 概要 Let us consider a trigonometric model in functional time series. In practice, functional data often exhibit periodic behaviors. Detecting these periodic behaviors helps us understand the functional features better. In this research, we propose a BIC-type information criterion for detecting the unknown number of periodicities. Additionally, we suggest an iterative algorithm that utilizes the residual processes obtained by the least squares method. We establish the consistency of this estimator minimizing the proposed multivariate and functional time series, thereby avoiding the issue of multiple testing.

Yoshihide Kakizawa (Hokkaido Univ.)

概要 The frequency domain analysis is considered in the stationary INAR(p) process under a general innovation. Here, we say that the innovation is general, if we do not assume its distributional form. In that case, the ML method is thus unavailable. Strong consistency and asymptotic normality of the Whittle estimator are established. It should be stressed that Silva and Oliveira (2004) gave some simulation studies about the Whittle estimation in the INAR(1) process with the Poisson marginals (Zhang and Wang (2015) for random coefficient INAR(1) process), without no theoretical results.

31	後藤佑一 (九大数理)♭ A test for counting sequences of integer-valued autoregressive models 藤森 洸 (信州大経法)
	概要 The integer autoregressive (INAR) model is one of the most commonly used models in nonnegative integer-valued time series analysis and is a counterpart to the traditional autoregressive model for continuous-valued time series. To guarantee the integer-valued nature, the binomial thinning operator or more generally the generalized Steutel and van Harn operator is used to define the INAR model. However, the distributions of the counting sequences used in the operators have been determined by the preference of analyst without statistical verification so far. In this talk, we propose a test based on the mean and variance relationships for distributions of counting sequences and a disturbance process to check if the operator is reasonable. We show that our proposed test has asymptotically correct size and is consistent.
32	Yujie Xue (統計数理研) Introduction of general distributions on sphere and torus in view of time 谷口正信(早大理工) series spectra 10 Yujie Xue (Inst. of Stat. Math.) Introduction of general distributions on sphere and torus in view of time Taniguchi Masanobu (Waseda Univ.) series spectra
	概要 There are various fields where observations are taken on directions in three dimensions, e.g., sphere and torus. Here we introduce a very general family of distributions on sphere and torus by use of time series spectra, which includes a lot of proposed classical one as special cases. Because time series spectra can be described by a lot of famous parametric models, e.g., AR, ARMA etc., we can develop the systematic model selection in this field by use of AIC, BIC, etc. Applications are very wide.

91 統計数学

概要 It is usually to design an experiment using treatments and its blocks in the design of experiments. Consider a set of edges of a complete bipartite graph as a treatments set and suppose the treatments have a structure. There is a one-to-one correspondence between the point set of a group divisible design (GDD) with v_1 groups of v_2 points and the edge set of a complete bipartite graph K_{v_1,v_2} . A block of GDD corresponds to a subgraph of K_{v_1,v_2} . Then the set of subgraphs also satisfies the spanning bipartite block design (SBBD) conditions. It's called GDD-type. In this talk, we introduce a method to construct a GDD-type SBBD directly from an (r, λ) -design and a difference matrix over a group.

Bartlett-type correction of the test statistics for sub-mean vector with two-step monotone missing data

(Aoyama Gakuin Univ.) Takashi Seo (Tokyo Univ. of Sci.)

概要 We consider the one-sample problem of testing for a sub-mean vector. In the case where the data set consists of complete data with $p(=p_1+p_2+p_3+p_4)$ dimensions and incomplete data with p_1+p_2 dimensions, we consider the one-sample problem of testing the $p_2+p_3+p_4$ mean vector, p_3+p_4 mean vector, and p_4 mean vector under the given mean vector of remaining dimensions. In considering these hypotheses, we construct test statistics based on Rao's U-statistic structure. Furthermore, we perform a probability expansion to obtain the distribution function of the test statistics and derive the upper 100α percentiles. We also propose a Bartlett-type corrected statistic. Moreover, we perform Monte Carlo simulations to verify approximation accuracy of the proposed approximate upper 100α percentiles and Bartlett-type correction.

概要 The best constants of discrete Sobolev inequalities corresponding to 1812 isomers of C60 fullerene are found. Classical mechanical models of these isomers with a linear spring on each edge are investigated. The best constants stand for rigidities of these models. We show the best constants of 1812 isomers are distinct rational numbers and among these, Buckyball (or equivalently truncated icosahedron) takes the least. In other words, one can say that the Buckyball is the most rigid among 1812 C60 fullerene isomers.

概要 Persistent homology is a powerful technique in topological data analysis employed to explore topological features of complex datasets. Multi-parameter persistent homology is less understood than one-parameter persistent homology because of its more intricate algebraic structure. This presentation will first introduce the interval rank invariant (under the compression system) of persistence modules. This allows us to define the interval replacement of persistence modules. Then, we will show the main contribution: providing an explicit and general formula to compute the interval rank invariant directly under any compression system, utilizing the Auslander–Reiten theory.

概要 A quadrature formula is a formula computing a definite integration by evaluation at a set of finitely many points (design). Examining the existence of certain rational quadrature formulas leads to applications to interesting problems such as Waring's problem in number theory and spherical design in combinatorics. A centrally symmetric quadrature is a central research object in the real case. What is a complex analogue of central symmetry? In many interesting quadratures for Bessel polynomials, the points appear with their Galois conjugates. Therefore, it seems natural to consider such quadratures (Galois conjugate quadratures) as a complex analogue of central symmetry. In this talk, we discuss such quadratures with examples. We also describe the relationship with a Diophantine problem called Prouhet-Tarry-Escott problem.

島輝 之 (アクセンチュア) 有理的区間デザインの明示的構成法について15 濹 憲 (神戸大システム情報) 正 寛(都 立 大理) 内 田 暁 南(岐 阜 大 工) Teruyuki Mishima On explicit construction of rational interval designs (Accenture Japan Ltd) Masanori Sawa (Kobe Univ.) Yukihiro Uchida (Tokyo Metro. Univ.) Xiao-Nan Lu (Gifu Univ.)

概要 If the integral of a polynomial with respect to a measure on an interval is represented as a linear combination of the values of the polynomial at finitely many points, this representation is called a quadrature formula. If all the coefficients of the linear combination are equal, the quadrature formula is called a Chebyshev-type quadrature formula, and the set of the points is called an interval design. In this talk, we give explicit construction of interval designs whose points are rational for a certain measure. We also investigate when this construction is applicable by classifying certain algebraic curves.

概要 Firstly, we give a condition that G_f is a covering graph of G_{f_1} for APN functions $f: \mathbb{F}_2^n \to \mathbb{F}_2^m$ and $f_1: \mathbb{F}_2^n \to \mathbb{F}_2^{m_1}$ with $m \geq m_1$, where G_f and G_{f_1} are incidence graphs (Cayley graphs) of f and f_1 . Using this condition, we see that, for APN functions, Dillon's property is preserved under CCZ-equivalence. Also, some results on Dillon's property are given.

加納幹雄(茨城 大*) Two degree factors of graphs and related topics Mikio Kano (Ibaraki Univ.*) Two degree factors of graphs and related topics

概要 We first present some results on (1, f)-odd factors of graphs, which is a generalization of a 1-factor, and then show some results on degree factors with red-blue vertex coloring of graphs, which is a new type of degree factors. We also present some results together with some problems related to these factors. For a function $f:V(G)\to\{1,3,5,..\}$, a spanning subgraph F of G is called a (1,f)-odd factor if $\deg_F(v)\in\{1,3,\ldots,f(v)\}$ for all vertices v of G. If f(v)=1 for every $v\in V(G)$, then a (1,f)-odd factor becomes a 1-factor. For two sets $\mathbb{S}_R, \mathbb{S}_B\subseteq \mathbb{Z}$ of integers, a spanning subgraph F of G is called a two-tone $(\mathbb{S}_R, \mathbb{S}_B)$ -factor of G if $\deg_F(x)\in \mathbb{S}_R$ for every red vertex x and $\deg_F(y)\in \mathbb{S}_B$ for every blue vertex y. For example, we show that for every red-blue vertex coloring of an r-regular graph G, in which the distance between any two red vertices is at least 3, G has a two-tone $(\{a\},\{k,k+1\})$ -factor, where r, a and b be integers such that $1\leq a\leq r$ and $0\leq k< r$.

9月4日(水) 第IV会場

9:00~11:40

概要 A spanning subgraph F in G is said to be a path-cycle system with respect to W if each component of F is either a path or a cycle, and the set of end-vertices of the paths in F is equal to W. For an integer $r \geq 4$, we prove that for an r-edge-connected $K_{1,r}$ -free r-regular graph G and a set of even number of vertices of G such that the distance between any two vertices of W in G is at least 3, G contains a path-cycle system with respect to W. We also showed that the conditions in the theorem are best possible in several meanings.

概要 In this talk, we study the upper and lower bounds for the number of facets of symmetric edge polytopes of connected graphs conjectured by Braun and Bruegge. In particular, we show that their conjecture is true for any graph that is the join of two graphs (equivalently, for any connected graph whose complement graph is not connected). It is known that any symmetric edge polytope is a centrally symmetric reflexive polytope. Hence our results give a partial answer to Nill's conjecture: the number of facets of a d-dimensional reflexive polytope is at most $6^{d/2}$.

概要 One of the invariants of graphs is the chromatic symmetric function invented by R.P. Stanley. The result of this study is a synthesis of two generalizations of this function. The first is a generalization using Kneser graphs, which is a complete invariant of simple graphs. The second is a generalization to vertex-weighted graphs. In this study, we newly generalize the vertex-weighted version using Kneser graphs. In conclusion, this new function was found to be a complete invariant of the vertex-weighted graph. In addition, this result allows us to construct a complete invariant for directed acyclic graphs and partially ordered sets.

<u>Kei Saito</u> (Nihon Univ.) A generalized spectral mapping theorem for quantum walks on graphs Daiju Funakawa (Hokkai-Gakuen Univ.)

概要 Quantum walk is a mathematical model which is a quantum version of the random walk, and many applications are known in various research fields, e.g., quantum information. It is important to clarify its eigenvalues and eigenvectors, and the spectral mapping theorem for quantum walk is a very useful tool. In this talk, we present a generalized spectral mapping theorem for quantum walk that can be applied to more general models.

概要 The main purpose of this talk is contributing to the study of the relationships between the quantum walks and their underlying graphs. The coarse Ricci curvature on graphs is usually defined using random walks. In this talk, we introduce a new definition of the coarse Ricci curvature induced from the Grover walk, which is one of the quantum walks. We refer to this curvature as Grover Ricci curvature. Notably, quantum walks can also be defined on hypergraphs, and we define the Grover Ricci curvature on hypergraphs aiming for further applications. This talk is based on Y. Fujitani and C. Kiumi, Quantum Inf Process 23, 180 (2024).

Kiyoto Yoshino

(Hiroshima Inst. of Tech.)

Sho Kubota (Aichi Univ. of Edu.)

概要 We provide a necessary and sufficient condition for perfect state transfer between two vertices in the Grover walk on a graph to occur. Additionally, we prove that automorphisms preserve the occurrence of perfect state transfer. In 2019, Zhan provided an infinite family of circulant graphs of valency 4 that admit perfect state transfer. As an application of our results, we characterize circulant graphs of valency at most 4 that admit perfect state transfer.

Construction of multivariate orthogonal polynomials related to birth Yusuke Ide (Nihon Univ.) and death chains Akihiro Narimatsu (Univ. of Fukuchiyama) Norio Konno (Ritsumeikan Univ./Yokohama Nat. Univ.*)

概要 In this talk, we consider multivariate orthogonal polynomials related to birth and death chains. In our construction, we consider d types of birth and death chains. Then we combine these d types of chains by using tensor product. Each of birth and death chains has reversible distribution then the probability transition matrix can be transformed to real symmetric matrix. Thus we can consider orthogonal polynomials related to the chains. By using tensor product construction, we obtain multivariate orthogonal polynomials. We also propose a concrete method for reduction from multivariate polynomial to univariate polynomial.

	<u>Hiroto Sekido</u> (Yokohama Nat. Univ.)	Periodicity and rhythmicity of quantum graph walks
	Etsuo Segawa (Yokohama Nat. Univ.)	

概要 Quantum graph walks are a quantum walk induced by the stationary Schrödinger equation on each vertex of a metric graph satisfying certain boundary conditions. Quantum graph walks are also a generalization of Grover walks. In this study, we obtain the parameters for a quantum graph walk defined from a strongly regular graph to be periodic and its period. In addition, we newly define a strike-in quantum walk, its rhythmicity, and its beat, and clarify the parameters that satisfy the conditions. The strike-in quantum walk is a model that includes quantum search, and rhythmicity is expected to play a role in controlling the length of a period. Periodicity is also a special case of rhythmicity.

		Pulsation of the quantum walk on the Johnson graph
	Etsuo Segawa (Yokohama Nat. Univ.)	

概要 In this talk, we introduce a phenomenon called "pulsation" in quantum walk. This phenomenon is as follows: For two connected graphs G_1, G_2 , we consider the composite graph formed by a disjoint union of G_1 and G_2 . In addition, we assume that the initial state exists only on G_1 . Then almost all states transfer to G_2 on a suitable step. Moreover, almost all states return to G_1 on a suitable step. These phenomena occur periodically. We analyzed the existence of this phenomenon when G_1 is the Johnson graph and G_2 is a star graph by using perturbation theory.

Karel Svadlenka (Tokyo Metro. Univ.) On an approximation method for anisotropic interfacial motions on obstacle

概要 While isotropic interfacial network motion is already well studied, theoretical understanding of curvature-driven motion of interfacial networks with anisotropic energies and global constraints is still lacking. In this talk, I will present theoretical analysis of an intermediate-level problem with three phases, where one phase plays the role of a fixed obstacle and one phase represents a volume-preserving anisotropic particle. A generalization of the so-called heat-content approximation leads to an approximation scheme, which is suitable for both theoretical existence analysis and numerical approximation. Both theoretical convergence results and numerical simulations will be shown.

Yu Ichida (Kwansei Gakuin Univ.) Global dynamics of a simple model for wild and sterile mosquitoes Yukihiko Nakata (Aoyama Gakuin Univ.)

概要 There are known methods to manage the population dynamics of wild and sterile mosquitoes by releasing genetically engineered sterile mosquitoes. Even if a two-dimensional system of ordinary differential equations is considered as a simple mathematical model for developing release strategies, fully understanding the global behavior of the solutions is challenging, due to that the probability of mating is ratio-dependent. In this talk, we combine a geometric approach called the time-scale transformation and blow-up technique to provide a complete understanding of dynamical systems near the origin. Then, the global behavior of the solution of the system is classified in a two-parameter plane represented by the natural death rate of mosquitoes and the sterile mosquito release rate.

31 Bendong Lou Asymptotic behavior for solutions to reaction-diffusion equations on a (Shanghai Normal Univ.) 本田善久(龍谷大*)

Bendong Lou (Shanghai Normal Univ.) Asymptotic behavior for solutions to reaction-diffusion equations on a $\underline{\text{Yoshihisa Morita}}$ (Ryukoku Univ.*) root-like metric graph

概要 We deal with symmetric solutions of the bistable reaction-diffusion equation on an unbounded root-like metric graph. Our goal is to provide a spreading-transition-vanishing trichotomy result on the asymptotic behavior for symmetric solutions with compact supported initial data on the graph. To this end, we need a convergence result for bounded and symmetric solutions to the equation. The convergence result can be proved using a version of zero number diminishing properties on the graph.

	Gen Nakamura (Hokkaido Univ.)	
	Goro Nishimura (Hokkaido Univ.)	

概要 In this talk, we concerns an inverse problem for fluorescence diffuse optical tomography (FDOT) reconstructing locations of multiple point targets from the measured temporal response functions. Peak time, the time when the temporal response function of the fluorescence reaches its maximum, is an important measurement in FDOT because it is most less suffered by noise. We derive an approximation peak time formula in an explicit way based on asymptotic analysis and the formula is verified numerically in a practical range of physical parameters including fluorescence lifetime.

概要 We consider a model problem of thermal convection in a long liquid layer under gravity with non-uniform heat supply. The system is described by the Oberbeck–Boussinesq equations in the two space-dimension. An existence theorem of stationary solutions is proved under some assumptions. Several flow patterns are obtained by the numerical computations which include the cases out of the assumptions of the existence theorem.

概要 We found two types of expressions for the Green's function G(x,y) in the boundary value problem with clamped conditions at both ends for the differential operator $(-1)^M (d/dx)^{2M}$ on the interval (-s,s) presented in the paper [1] published in 2011. By determining the maximum value of the diagonal value G(y,y) for $|y| \leq s$, the best constant for the corresponding Sobolev inequality was calculated. In this presentation, in addition to the matrix representation of the Green's function in the boundary value problem with clamped conditions at both ends for the differential operator $(-1)^M (d/dx)^{2M}$ on the interval (0,1), a newly obtained integral representation is reported. Furthermore, the positivity of the Green's function is deduced from this integral representation.

 - <u>Toshiko Ogiwara</u> (Josai Univ.) Propagating direction of bistable traveling fronts in the Lotka–Volterra Ken-Ichi Nakamura (Meiji Univ.) competition-diffusion system

概要 We consider front propagation in the classical 2-species Lotka-Volterra competition-diffusion system under strong competition conditions. The system has a unique traveling front solution (up to translation) connecting two stable states. The sign of the front speed gives us significant information about which species prevails over the other, and identifying the sign is still a challenging problem. In this talk, we give some new results on the sign of the speed of bistable traveling fronts based on comparison arguments. The results determine the propagation direction of the front for a much broader range of parameters than previous results.

概要 In this study, we investigate the numerical stability of the covariant Baumgarte-Shapiro-Shibata-Nakamura (cBSSN) formulation against homogeneous and isotropic spacetime. To evaluate the numerical stability, we calculate the constraint amplification factor (CAF), which is obtained from an eigenvalue analysis of the evolution of the constraint. We propose a modification to the time evolution equations of the cBSSN formulation that achieves higher numerical stability.

<u>Yu Ichida</u> (Kwansei Gakuin Univ.) Geometric approach to the bifurcation at infinity: A case study Takashi Sakamoto (Meiji Univ.)

概要 In this talk, the reaction-diffusion equation in space 1D with negative power nonlinearity is presented as an example the stationary solutions of which are characterized by the bifurcation at infinity. The all dynamics, including to infinity, of the ordinary differential equation concerning with the stationary problem of the reaction-diffusion equation are obtained by the Poincaré-type compactification. The results of this talk give relationship between the bifurcation at infinity of the stationary solutions for the reaction-diffusion equation and the connecting orbits of the ordinary differential equations, especially, that connect the equilibria at infinity. Moreover, this result also answers the question of what kind of solutions appear (or disappear) associated with the bifurcation.

	Takashi Sakajo (Kyoto Univ.)	dynamics with multiplicative covariance inflation

概要 Data assimilation is a method of uncertainty quantification to estimate the hidden true state by updating the prediction owing to model dynamics with observation data. As a prediction model, we consider a class of nonlinear dynamical systems on Hilbert spaces. For nonlinear model dynamics, the ensemble Kalman filter (EnKF) is often used to approximate the probability distribution with a set of particles called an ensemble. Especially, a deterministic version of the EnKF known as the ensemble transform Kalman filter (ETKF) performs well even with limited ensemble sizes compared to other stochastic implementations of the EnKF. Despite the practical effectiveness of the ETKF, little is theoretically known. The present study aims to establish the theoretical analysis of the ETKF.

		culating eigenvalues of differential operators by using auto-cancellations
		of the singularities of their eigenfunctions

概要 In this study, a new integer-type algorithm is proposed for calculationg eigenvalues of linear differential operators with a high accuracy, by using a kind of auto-cancellation of the singularities caused by the deviations of eigenvalues from exact ones. This algorithm is based on non-linear eigenvalue problems in terms of the powers of the left hand sides of the characteristic equations of the linear differential operators. Theoretically the numerical performance of this algorithm has p-th order convergence, with p aritrary chosen, Some successfull numerical results are given in this presentation.

49 飯 田 渓 太 (阪大蛋白質研) Semiology-based clustering method for single-cell data · · · · · · · · · · · · 15 Keita Iida (Osaka Univ.) Semiology-based clustering method for single-cell data

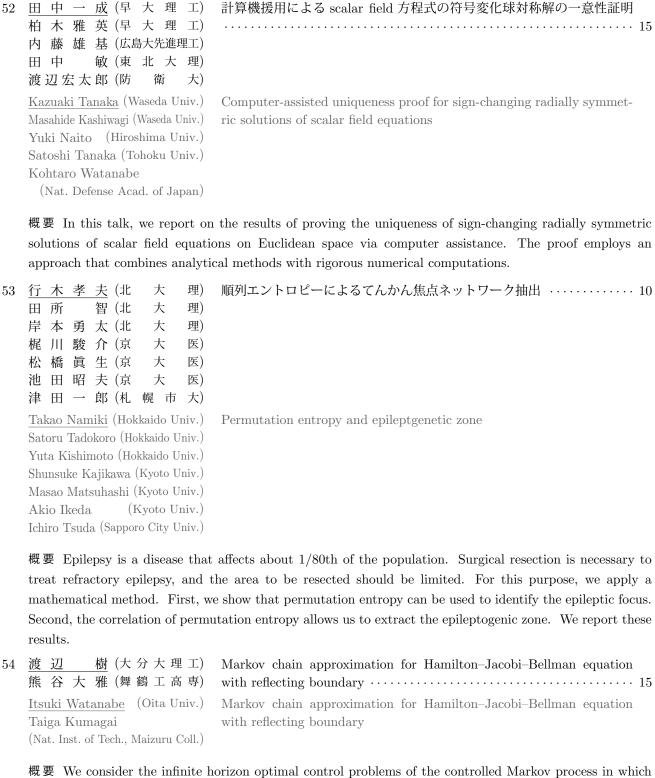

概要 Various cells in living tissues produce numerous molecules to sustain life. However, the molecular basis of life is complex, making theoretical elucidation of its control mechanisms difficult. Here, we present ASURAT, a computational tool for unsupervised clustering and functional annotation of cell type, biological process, and signaling pathway activity for single-cell data (Iida, Bioconductor, 2022). We apply ASURAT to human pancreatic cancer data and identify previously overlooked subpopulations (Iida et al., Bioinformatics, 2022). ASURAT is a powerful tool for dissecting cell subpopulations and improving the biological interpretability of complex and noisy transcriptomic data.

14:15~16:00

概要 Periodic solutions appearing in the 3-valued Greenberg Hastings cellular automaton on rectangular lattice points are studied. Here, a von Neumann neighborhood type was used for the interaction between lattice points. Vorticity was used as an index and was shown to be an invariant quantity. Using this index, it was shown that there are restrictions on spontaneously occurring periodic solutions. The results suggest that the 3-period solution is the strongest and the 4-period solution is the weakest. It was also shown that there is no 5-period solution.

概要 The objective of this work is to investigate the asymptotic behavior of the persistence diagrams of a random cubical filtration as the window size tends to infinity. Here, a random cubical filtration is an increasing family of random cubical sets, which are the union of randomly generated higher dimensional unit cubes with integer coordinates in a Euclidean space. In this talk, we discuss the exponential decay rate of the probability that the persistence diagram is far from the typical behavior. This is the first result on the large deviation behavior of persistence diagrams. (Joint work with Yasuaki Hiraoka, Jun Miyanaga, and Kenkichi Tsunoda)

109 応用数学

概要 We consider the infinite horizon optimal control problems of the controlled Markov process in which the state 0 is reflecting state. We verify the relationship between the controlled Markov process and its fluid limit by the viscosity solution approach. More precisely, we show that the value function of the controlled Markov process converges to one of its limit process which is the viscosity solution of the corresponding Hamilton–Jacobi–Bellman equation with Neumann boundary condition.

概要 SARSA and Q-learning are two typical methods of reinforcement learning. We first describe the learning behavior of these two algorithms. Then, we propose a hybrid algorithm that combines these two methods. Finally, we show a convergence result for the proposed hybrid algorithm and demonstrate numerical experiments on the learning behaviors.

中 井 拳 吾 (岡山大環境生命) Evaluation of a data-driven model using reservoir computing from dynamical system point of view

Kengo Nakai (Okayama Univ.) Evaluation of a data-driven model using reservoir computing from dynamical system point of view

概要 It has been reported that reservoir computing is effective in the inference of time-series and some characteristics. A reservoir is a recurrent neural network whose internal parameters are not adjusted to fit the data in the training process. What is done is to train the reservoir by feeding it an input time-series and fitting a linear function of the reservoir state variables to a desired output time-series. We have succeeded in modeling a macroscopic behavior of a three-dimensional chaotic fluid flow, which requires only past time-series data as training data. A single model can infer short time behaviors from various initial conditions. The model also generates statistical properties which mimic the original ones. However, it is not clear to what extent a model constructed by reservoir computing can capture dynamical structures. We confirm that dynamical properties such as fixed points, periodic orbits, and non-hyperbolic structures can be reconstructed by reservoir computing. We will discuss these results and some ongoing works. This talk is based on [1,2].

- 概要 In thik talk, we provide a new characterization of isomorphism classes of generalized Alexander quandles in terms of the underlying groups and their automorphisms. This extends the previous result Higashitani–Kurihara (2024). Additionally, we give the computational results of the number of generalized Alexander quandles up to quandle isomorphism arising from groups up to order 127 and their group automorphisms.
- - 概要 The fine curve graph of a surface was introduced by Bowden, Hensel, and Webb as a graph consisting of the actual essential simple closed curves on the surface. Long, Margalit, Pham, Verberne, and Yao proved that the automorphism group of the fine curve graph of a closed orientable surface S_g of genus $g \geq 2$ is isomorphic to the homeomorphism group of the surface. Based on their argument, we generalized their result to closed nonorientable surfaces N_g of genus $g \geq 4$.

 Susumu Hirose (Tokyo Univ. of Sci.) On generating mapping class groups by pseudo-Anosov elements

 Naoyuki Monden (Okayama Univ.)
 - 概要 Wajnryb proved that the mapping class group of a closed oriented surface is generated by two elements. We prove that the mapping class group is generated by two pseudo-Anosov elements. In particular, if the genus is greater than or equal to nine, we can take the generators to two conjugate pseudo-Anosov elements with arbitrarily large dilatations. Another result we prove is that the mapping class group is generated by two conjugate reducible but not periodic elements if the genus is greater than or equal to eight. We also give similar results to the first and third results for the hyperelliptic mapping class group when the genus is greater than or equal to one.

4	笠 原	泰 (高知工科大)	Low dimensional MCG-invariant representations of surface groups in
			the naive deformation spaces · · · · · · · · · · · · · · · · · · ·
	Yasushi	Kasahara	Low dimensional MCG-invariant representations of surface groups in
		(Kochi Univ. of Tech.)	the naive deformation spaces

概要 We report that the Franks-Handel and the Korkmaz theorems on low dimensional linear representations of pure mapping class group of orientable surface (MCG) of sufficiently large genus implies the triviality of the linear representations of the corresponding surface group into GL(r,C) with the property of the title, provided r be less than or equal to the square root of twice the genus of the surface. To derive the result, we apply our construction of linear representation of the MCG starting with a representation of the corresponding surface group MCG-invariant in the naive deformation space we once used to derive the "visualization of the linearity problem" for the MCG.

5 谷口東曜 (東大数理) Topology of loops via non-commutative differential geometry · · · · · · · 15
Toyo Taniguchi (Univ. of Tokyo) Topology of loops via non-commutative differential geometry

概要 The Turaev cobracket is a topologically defined operation on the space of free loops on an oriented surface. When the surface is further bordered and compact, it is factored into two maps in a paper by Alekseev-Kawazumi-Kuno-Naef, one of which is called the divergence map. We reconstruct it in terms of non-commutative differential geometry featuring a non-commutative analog of a flat connection and generalize it to the case of closed surfaces.

6 和 久 田 葵 (東 大 数 理) Thurston-Wolpert-Goldman Lie 代数の中心定理の一般化 · · · · · · · · · 15
Aoi Wakuda (Univ. of Tokyo) A generalization of the Center Theorem of the Thurston-Wolpert-Goldman Lie algebra

概要 The Goldman Lie algebra of an oriented surface was defined by Goldman. By the natural involution that opposes the orientation of curves, the Goldman Lie algebra becomes a \mathbb{Z}_2 -graded Lie algebra. Its even part is isomorphic to the Thurston-Wolpert-Goldman Lie algebra or, briefly, the TWG Lie algebra. Chas and Kabiraj proved the center of the TWG Lie algebra is generated by the class of the unoriented trivial loop and the classes of unoriented loops parallel to boundary components or punctures. The center of the even part can be rephrased as the set of elements of the even part annihilated by all the elements of the even part.

概要 The trajectory of quadratic differentials on Riemann surfaces is an important object in mathematics and mathematical physics. Similar theories for higher-order differentials (spectral networks, Stokes diagrams) have also attracted attention in WKB analysis, Teichmuller theory, and related mathematical physics, but little is known about them. In this talk, we will outline the existence of spectral networks in the case of general higher-order differentials.

今野北斗(東大数理) Diffeomorphism group and gauge theory

Hokuto Konno (Univ. of Tokyo) Diffeomorphism group and gauge theory

概要 The group of diffeomorphisms of a given smooth manifold is a fundamental object of study for topologists and geometers. One of the major advances in topology over the past decade concerns diffeomorphism groups of higher-dimensional manifolds, led by many researchers such as Galatius and Randal-Williams. On the other hand, it has been well-known since the last century that 4 is a special dimension in the classification of manifolds. Special phenomena are typically described in terms of comparisons between the topological and smooth categories, and they are detected using gauge theory. In recent years, advances in gauge theory for families have revealed that special phenomena in dimension 4 also occur for diffeomorphism groups in various ways, contrasting with recent results in higher dimensions. I will survey these new special phenomena in dimension 4, also from the perspective of comparisons between the topological and smooth categories.

細野 忍(学習院大理) カラビ・ヤウ多様体の族とミラー対称性

Shinobu Hosono (Gakushuin Univ.) Families of Calabi-Yau manifolds and mirror symmetry

概要 Mirror symmetry of Calabi—Yau manifolds is a mysterious symmetry that interchanges the complex geometry of one Calabi—Yau manifold with the symplectic geometry of another Calabi—Yau manifold, called a mirror manifold. 30 years after its discovery, we now have fascinating proposals, such as homological mirror symmetry and SYZ geometric mirror construction, to describe the symmetry mathematically. In this talk, however, I will describe this symmetry in terms of two different, and classical, nilpotent linear actions associated with a Calabi—Yau manifold. One is the Lefschetz action in the hard Lefschetz theorem (which I call A-structure), and the other is a certain monodromy action that arises from a family of Calabi—Yau manifolds (B-structure). I define mirror symmetry as the symmetry which exchanges these two structures. The general existence of a mirror Calabi—Yau manifold for a given Calabi—Yau manifold is still an open problem. However, mirror symmetry defined by these classical actions motivates us to study/construct families of Calabi—Yau manifolds, and to look into the boundary points where Calabi—Yau manifolds degenerate in a specific way. Based on my collaborations with Hiromichi Takagi since 2010, I will present interesting families of Calabi—Yau threefolds which are parametrized by two-dimensional toric varieties.

	Masato Tanabe (H	lokkaido Univ.)	Immersions of surface singularity links and their topology

概要 A surface singularity in complex 3-space defines a closed orientable 3-manifold, known as the link or the Milnor fiber boundary, in a small 5-sphere centered at the singularity itself. The inclusion map of this 3-manifold into the 5-sphere can be considered as an immersion. In this talk, we determine the regular homotopy class of the inclusion map by computing a complete invariant which was introduced by Wu and Saeki-Szűcs-Takase. Furthermore, for each singularity of type ADE, we demonstrate the regular homotopicity between the inclusion map and Kinjo's immersion.

Noboru Ogawa (Tokai Univ.) Suspension configuration of Liouville domains and compressibility of Toru Yoshiyasu (Kyoto Univ. of Edu.) contact manifolds

概要 Inspired by Huang's work, we studied the compressibility of contact manifolds and the suspension configuration of Liouville domains. We show that compressible contact manifolds are tight. If time permits, we will also discuss some new concrete examples and applications.

概要 Several methods have been proposed to define tangent spaces for diffeological spaces. Among them, the internal tangent functor is obtained as the left Kan extension of the tangent functor for manifolds. However, the right Kan extension of the same functor has not been well-studied. In this paper, we investigate the relationship between this right Kan extension and the external tangent space, another type of tangent space for diffeological spaces. We prove that by slightly modifying the inclusion functor used in the right Kan extension, we obtain a right tangent space functor, which is almost isomorphic to the external tangent space. Furthermore, we show that when a diffeological space satisfies a favorable property called smoothly regular, this right tangent space coincides with the right Kan extension mentioned earlier.

概要 Whitney umbrella is a singularity which appears most frequently on surfaces. To study differential geometry on a surface, a unit normal vector plays a central role. However, a unit normal vector on Whitney umbrella is not extended. We show that we can extend a unit normal vector beyond a Whitney umbrella if we consider a curve passing through Whitney umbrella. We then study geometry by using invariants defined by a Darboux frame consisting of smoothly defined unit normal and tangent vectors along a curve passing through Whitney umbrella. We also give geometric meanings of the invariants.

概要 We prove that the extremal stratification of an Alexandrov space defines a CS structure in the sense of Siebenmann. An Alexandrov space is a metric space with sectional curvature bounded below in the generalized sense. The extremal stratification is a decomposition of an Alexandrov space into its geometrically singular sets. The CS structure is a type of topological stratification, i.e., a decomposition of a topological space into topological manifolds of different dimensions. The main theorem improves an earlier result of Perelman—Petrunin, who introduced the extremal stratification.

Ken'ichi Yoshida (Hiroshima Univ.) 概要 A doubly periodic tangle is the lift of a link in the thickened torus by the universal covering. Then this link is called a motif of a doubly periodic tangle. To investigate doubly periodic tangles, it is necessary to consider relations between finite coverings and isotopies of links in the thickened torus. In this presentation, we show two results. If two links in the thickened torus have isotopic lifts in a common finite covering, then they are isotopic. A non-split doubly periodic tangle has a unique minimal motif. To prove these, we use the standard decomposition of the complement of a link. 吉 田 建 一 (広島大SKCM2) 四元数群からえられる多様体内の絡み目とそのリフト10 Ken'ichi Yoshida (Hiroshima Univ.) Links in the spherical 3-manifold obtained from the quaternion group and their lifts

概要 The free action of the quaternion group Q_8 on the 3-sphere S^3 induces the spherical 3-manifold S^3/Q_8 . The manifold S^3/Q_8 is covered by the lens space L(4,1) in three ways. A link in S^3/Q_8 has three different lifts in L(4,1) in general. However, their lifts in S^3 coincide. In fact, we obtain infinitely many triples of hyperbolic links in L(4,1) such that the three lifts of each triple in S^3 are isotopic.

概要 Given a finite group G, we define a new invariant of odd-dimensional oriented closed manifolds and call it the KDW invariant. This invariant is the Dijkgraaf-Witten invariant in terms of K-homology. In this paper, we compute the KDW invariants of some Brieskorn homology spheres with $G = \operatorname{PSL}(\mathbb{F}_p)$ without 2-torsion. We should remark that, in these computational results, both the fundamental groups of the Brieskorn homology spheres and $\operatorname{PSL}(\mathbb{F}_p)$ are not nilpotent. In the previous studies, there have been no computational results of the Dijkgraaf-Witten invariants in cases where both the fundamental groups of manifolds and finite groups are not nilpotent.

 Natsuya Takahashi (Osaka Univ.) Non-diffeomorphic minimal genus relative trisections of the same 4manifold with boundary
 - 概要 It is known that every compact smooth 4-manifold X admits a (relative) trisection, which is a decomposition of X into three 4-dimensional 1-handlebodies intersecting along a compact surface. In this talk, we show that there exists a 4-manifold with a boundary that admits two non-diffeomorphic minimal genus relative trisections. To prove this, we use a simple operation that produces a trisection diagram of a closed 4-manifold from a relative trisection diagram.
- 38 <u>磯 島 司</u> (東 工 大 理) Nielsen equivalence and multisections of 4-manifolds · · · · · · · · · · 15 小 川 将 輝 (東北大MathCCS)

 Tsukasa Isoshima (Tokyo Tech) Nielsen equivalence and multisections of 4-manifolds Masaki Ogawa (Tohoku Univ.)
 - 概要 A trisection is roughly a decomposition of a closed, oriented, smooth 4-manifold into three 4-dimensional 1-handlebodies. As an extension of a trisection, Islambouli and Naylor introduced a multisection or n-section which is a decomposition of a closed, oriented, smooth 4-manifold into n 4-dimensional 1-handlebodies for $n \geq 3$. when n = 2, it is called a bisection. Islambouli proved, using a Nielsen equivalent, that for any integer $n \geq 2$, there exist 4-manifolds with non-isotopic (3n, n)-trisections of minimal genus. In this talk, we report that for any integer $n \geq 2$, there exist 4-manifolds with non-isotopic (2n, n)-bisections of minimal genus. We also introduce a similar result for 4-sections.
- - 概要 Charts are oriented labeled graphs in a disk. A chart represents an oriented closed surface embedded in 4-space. For each label m, we denote by Γ_m the subset of a chart Γ consisting of edges of label m. For any subset X of Γ , we denote by w(X) the number of white vertices in X. In this talk, we show the following.
 - Let Γ be a chart. If Γ is a chart of type (m; 2, 4, 2) (In other words, there exists label m such that $w(\Gamma_m \cap \Gamma_{m+1}) = 2, w(\Gamma_{m+1} \cap \Gamma_{m+2}) = 4, w(\Gamma_{m+2} \cap \Gamma_{m+3}) = 2, w(\Gamma) = 8$), and if Γ is a minimal chart, then there does not exist any lens of Γ of type 2. Here, a lens is a disk D such that ∂D contains exactly two white vertices and $\partial D \subset \Gamma_m \cup \Gamma_{m+1}$ for some label m and D satisfies some conditions.

<u>Jumpei Yasuda</u> (Osaka Univ.) Knitted surfaces and presentations of knotted surfaces in a four ball Inasa Nakamura (Saga Univ.)

概要 In 1983, Rudolph introduced braided surfaces as a generalization of braids. He showed that every properly embedded orientable surface with boundaries in a 4-ball is ambiently isotopic to a braided surface if and only if it is ribbon. In this talk, we generalize this concept and introduce knitted surfaces, using knits. Here, knits are a generalization of braids by J. Murakami. We show that every properly embedded surface with boundaries in a 4-ball is ambiently isotopic to a knitted surface.

	Yumi Arai (Ochanomizu Univ.) <u>Kouichi Takemura</u> (Ochanomizu Univ.)	On q -middle convolution and q -hypergeometric equations, I			
	概要 Sakai and Yamaguchi introduced a q -deformation of the middle convolution some time ago. Motivated by applications to special functions, we reformulate the q -middle convolution and the associated q -integral transformations. We obtain a better description of additivity on composition of the q -middle convolution by our reformulation.

信 川 喬 彦(神 戸 大 理) 点平等な q 超幾何方程式としての $_{10}W_9 \cdot _8W_7 \cdot$ 変異版 $_2\varphi_1$

Takahiko Nobukawa (Kobe Univ.) $_{10}W_9$, $_8W_7$ and variant of $_2\varphi_1$ as democratic q-hypergeometric equations

概要 In this talk, we first study the variant of q-hypergeometric equation for $_2\varphi_1$ defined by Hatano–Matsunawa–Sato–Takemura (Funkcial. Ekvac., 2022). We give Euler type integral solutions, series solutions in terms of very-well-poised q-hypergeometric series $_8W_7$ for the equation, and connection formulas for these solutions. Second, we introduce a similar extension of the q-hypergeometric equation for $_3\varphi_2$. We construct Euler type integral solutions and series solutions in terms of $_{10}W_9$ for the equation. These results are obtained using the democratic viewpoint. Here the word "democratic" means that every point can be treated equally.

	概要 Let G be the special linear group $SL_n(\mathbb{C})$, and let T be its maxime T -equivariant K-homology ring $K_*^T(Gr_G)$ of the affine Grassmannian G to outline two realizations of $K_*^T(Gr_G)$. One is the realization through the "double K- k -Schur functions" representing Schubert classes. The coordinate ring $\mathcal{O}(\mathcal{Z}_{G^\vee})$ of the affine variety \mathcal{Z}_{G^\vee} over T determine based on joint work with Takeshi Ikeda, Shinsuke Iwao, Satoshi Naito, a	he algebra $\hat{\Lambda}_G^{R(T)}$, which is spanned the other is the realization through d by $G^{\vee} = \mathrm{PGL}_n(\mathbb{C})$. 	Akito Tatekawa (Meiji Univ.) Calculating the energy functions of dia sions as a generalization of the Kitaev		
	概要 The Kitaev model is an exactly solvable model of a spin $1/2$ system on a honeycomb lattice. The purpose of this talk is to describe energy functions of diamond lattices of general dimensions as a generalization of the Kitaev model. The diamond lattices of general dimensions are defined by the A_{d} -crystal. We describe the Hamiltonian by means of Majorana operators based on the Clifford algebra. Then we express the energy function as eigenvalues of the Hamiltonian by using the discrete Fourier transform. For this calculation we make use of a method of a base graph developed by Sunada in the framework of topological crystallography. We show that the energy function is identified with the one appearing in the tight biding model of diamond lattices of general dimensions.

中 屋 敷 厚 (津田塾大学芸) KP 階層の準周期解と頂点作用素

Atsushi Nakayashiki (Tsuda Coll.) Quasi-periodic solutions of the KP-hierarchy and vertex operator

概要 The KP-hierarchy is the infinite system of differential equations containing the Kadomtsev-Petviashvili (KP) equation as a part. The vertex operator of the KP-hierarchy transforms one solution to another one. Quasi-periodic solutions of the KP-hierarchy are those described by theta functions of non-singular algebraic curves. We apply the vertex operators to quasi-periodic solutions and study their properties. Such solutions had appeared in the study of limits of quasi-periodic solutions. We show, in general, that solutions thus obtained correspond to singular algebraic curves and rank one torsion free sheaves on them. We use the Sato Grassmannian for this purpose. We also show that the solutions obtained here are considered as solitons on quasi-periodic backgrounds.
