- Define

$$F(\mathbb{R}^n, j) = \{(\mathbf{x}_1, \dots, \mathbf{x}_j) \in (\mathbb{R}^n)^j \mid \mathbf{x}_i \neq \mathbf{x}_k \text{ if } i \neq k\}.$$

This is called the configuration space of j points in \mathbb{R}^n .

Configuration Spaces and Iterated Loop Spaces

- We have a Σ_j -equivariant homotopy equivalence

$$F(\mathbb{R}^n, j) \simeq_{\Sigma_j} \mathcal{C}_n(j).$$

Problem. Use $\mathcal{C}_n(j)$ or $F(\mathbb{R}^n, j)$ to study the homology of $\Omega^n \Sigma^n X$.

- Several methods are known for studying the homology of iterated loop spaces.
 - The Serre spectral sequence.
 - Homology operations.
 - The Eilenberg-Moore spectral sequence.
 - . . .

The Serre Spectral Sequence

- We have a fibration

$$\Omega^n \Sigma^n X \longrightarrow P\Omega^{n-1} \Sigma^n X \longrightarrow \Omega^{n-1} \Sigma^n X.$$

where $PY = \{\ell : I \rightarrow Y \mid \ell(0) = y_0\} \simeq *$.

- And we obtain a spectral sequence

$$\begin{aligned} E_{s,t}^2 &\cong H_s(\Omega^{n-1} \Sigma^n X; h_t(\Omega^n \Sigma^n X)) \\ &\implies h_{s+t}(P\Omega^{n-1} \Sigma^n X) \cong h_{s+t}(*) \end{aligned}$$

for a homology theory $h_*(-)$.

- And we obtain a spectral sequence

$$\begin{aligned} E_{s,t}^2 &\cong H_s(\Omega^{n-1} \Sigma^n X; h_t(\Omega^n \Sigma^n X)) \\ &\implies h_{s+t}(P\Omega^{n-1} \Sigma^n X) \cong h_{s+t}(*). \end{aligned}$$

for a homology theory $h_*(-)$.

- This method works if $h_*(-) = H_*(-; \mathbb{F}_p)$. (Araki-Kudo, Dyer-Lashof, Browder, F. Cohen.)

where $PY = \{\ell : I \rightarrow Y \mid \ell(0) = y_0\} \simeq *$.

- And we obtain a spectral sequence

$$\begin{aligned} E_{s,t}^2 &\cong H_s(\Omega^{n-1} \Sigma^n X; h_t(\Omega^n \Sigma^n X)) \\ &\implies h_{s+t}(P\Omega^{n-1} \Sigma^n X) \cong h_{s+t}(*). \end{aligned}$$

for a homology theory $h_*(-)$.

- This method works if $h_*(-) = H_*(-; \mathbb{F}_p)$. (Araki-Kudo, Dyer-Lashof, Browder, F. Cohen.)
- When $h_*(-)$ is not an ordinary homology (e.g. K -theory), this method fails.

The Eilenberg-Moore Spectral Sequence

- For a multiplicative homology theory $h_*(-)$ satisfying the Künneth isomorphism, we have a spectral sequence

$$E_{s,t}^2 \cong \text{Cotor}_{s,t}^{h_*(Y)}(h_*(*), h_*(*)) \implies h_{s+t}(\Omega Y),$$

which may or may not converge.

- When h_* is a nonconnective homology theory, such as K -theory, the spectral sequence behaves badly.

The Eilenberg-Moore Spectral Sequence

- For a multiplicative homology theory $h_*(-)$ satisfying the Künneth isomorphism, we have a spectral sequence

$$E_{s,t}^2 \cong \text{Cotor}_{s,t}^{h_*(Y)}(h_*(*), h_*(*)) \implies h_{s+t}(\Omega Y),$$

which may or may not converge.

- When h_* is a nonconnective homology theory, such as K -theory, the spectral sequence behaves badly.
- We have

$$E_{s,t}^2 \cong \text{Cotor}_{s,t}^{h_*(\Omega^{n-1}\Sigma^n X)}(h_*(*), h_*(*)) \implies h_{s+t}(\Omega^n \Sigma^n X).$$

The Braid

Arrangement

Idea: Filter $\mathcal{C}_n(j)$ by measuring the overlaps in the first coordinates.

The Gravity Filtration

- There exists a filtration on $\mathcal{C}_n(j)$

$$\begin{aligned} \emptyset = F_{-j-1}\mathcal{C}_n(j) \subset F_{-j}\mathcal{C}_n(j) \subset \cdots \\ \subset F_{-2}\mathcal{C}_n(j) \subset F_{-1}\mathcal{C}_n(j) = F_0\mathcal{C}_n(j) = \mathcal{C}_n(j). \end{aligned}$$

satisfying the following conditions:

- $\mathbf{c} = (c_1, \dots, c_j) \in F_{-s}\mathcal{C}_n(j) \iff$ there exists

$$\{1, \dots, j\} = S_1 \amalg \cdots \amalg S_{s+k} \quad (k \geq 0)$$

such that each collection of cubes $\{c_i \mid i \in S_\ell\}$ is “stable under gravity (and anti-gravity)” with respect to the first coordinate.

- In other words, we need to divide $\{c_1, \dots, c_j\}$ into at least s groups each of which is “stable under gravity (and anti-gravity)” with respect to the first coordinate.

The Snaith Splitting

- The filtration on $\mathcal{C}_n(j)$ is not compatible with the base point relation in the definition of

$$C_n(X) = \left(\coprod_j \mathcal{C}_n(j) \times_{\Sigma_j} X^j \right) / \sim.$$

- (Snaith, 1974.) We have a stable homotopy equivalence

$$\Sigma^\infty C_n(X) \simeq \Sigma^\infty \left(\bigvee_j \mathcal{C}_n(j)_+ \wedge_{\Sigma_j} X^{\wedge j} \right)$$

- The filtration on $\mathcal{C}_n(j)$ is not compatible with the base point relation in the definition of

$$C_n(X) = \left(\prod_j \mathcal{C}_n(j) \times_{\Sigma_j} X^j \right) / \sim.$$

- (Snaith, 1974.) We have a stable homotopy equivalence

$$\Sigma^\infty C_n(X) \simeq \Sigma^\infty \left(\bigvee_j \mathcal{C}_n(j)_+ \wedge_{\Sigma_j} X^{\wedge j} \right)$$

hence

$$\tilde{h}_*(C_n(X)) \cong \bigoplus_j \tilde{h}_*(\mathcal{C}_n(j)_+ \wedge_{\Sigma_j} X^{\wedge j}).$$

The Gravity Spectral Sequence

- The gravity filtration on each $\mathcal{C}_n(j)$ defines a filtration on the j -th Snaith summand $\mathcal{C}_n(j)_+ \wedge_{\Sigma} X^{\wedge j}$.
- We obtain a spectral sequence

$$E^2(j) \implies \tilde{h}_*(\mathcal{C}_n(j)_+ \wedge_{\Sigma} X^{\wedge j})$$

for each j .

- By taking the direct sum, we obtain a spectral sequence

$$\begin{aligned} E^2 &= \bigoplus_j E^2(j) \implies \bigoplus_j \tilde{h}_*(\mathcal{C}_n(j)_+ \wedge_{\Sigma} X^{\wedge j}) \\ &\cong \tilde{h}_* \left(\bigvee_j \mathcal{C}_n(j)_+ \wedge_{\Sigma} X^{\wedge j} \right) \\ &\cong \tilde{h}_*(C_n(X)) \\ &\cong \tilde{h}_*(\Omega^n \Sigma^n X). \end{aligned}$$

Braid Arrangement?

The Braid Arrangement

- We have

$$\begin{aligned} \mathcal{C}_n(j) &\simeq F(\mathbb{R}^n, j) \\ &= \mathbb{R}^j \otimes \mathbb{R}^n - \bigcup_{i, i'} L_{i, i'} \otimes \mathbb{R}^n, \end{aligned}$$

where

$$L_{i, i'} = \{(x_1, \dots, x_j) \in \mathbb{R}^j \mid x_i = x_{i'}\}.$$

- $\{L_{i, i'} \mid 1 \leq i < i' \leq j\}$: a central arrangement in \mathbb{R}^j .
- $\mathfrak{h}_j = \{(x_1, \dots, x_j) \in \mathbb{R}^j \mid x_1 + \dots + x_j = 0\}$.
- $\mathcal{A}_{j-1} = \{L_{i, i'} \cap \mathfrak{h}_j \mid 1 \leq i < i' \leq j\}$: the braid arrangement.
- \mathcal{A}_{j-1} is a real essential central arrangement in \mathfrak{h}_j .

- Define the set of ordered partition of $\{1, \dots, j\}$ by

$$\Pi_j = \prod_{s=1}^j \{\lambda : \{1, \dots, j\} \rightarrow \{1, \dots, s\} \mid \text{surjections}\}.$$

- For $\lambda \in \Pi_j$, define

$$F_\lambda = \left\{ (x_1, \dots, x_j) \in \mathbb{R}^j \mid \begin{array}{l} x_i < x_{i'} \text{ if } \lambda(i) < \lambda(i') \\ \text{and } x_i = x_{i'} \text{ if } \lambda(i) = \lambda(i') \end{array} \right\}$$

Then

$$\mathcal{L}(\mathcal{A}_{j-1}) = \{F_\lambda \mid \lambda \in \Pi_j\}.$$

- Chambers correspond to bijections, hence

$$\mathcal{L}^{(0)}(\mathcal{A}_{j-1}) = \Sigma_j.$$

Cells of the Salvetti Complex of the Braid Arrangement

For an ordered partition $\lambda \in \Pi_j$ of rank r and $\sigma \in \Sigma_j$ which is a subdivision of λ , define a symbol $S(\lambda, \sigma)$ as follows:

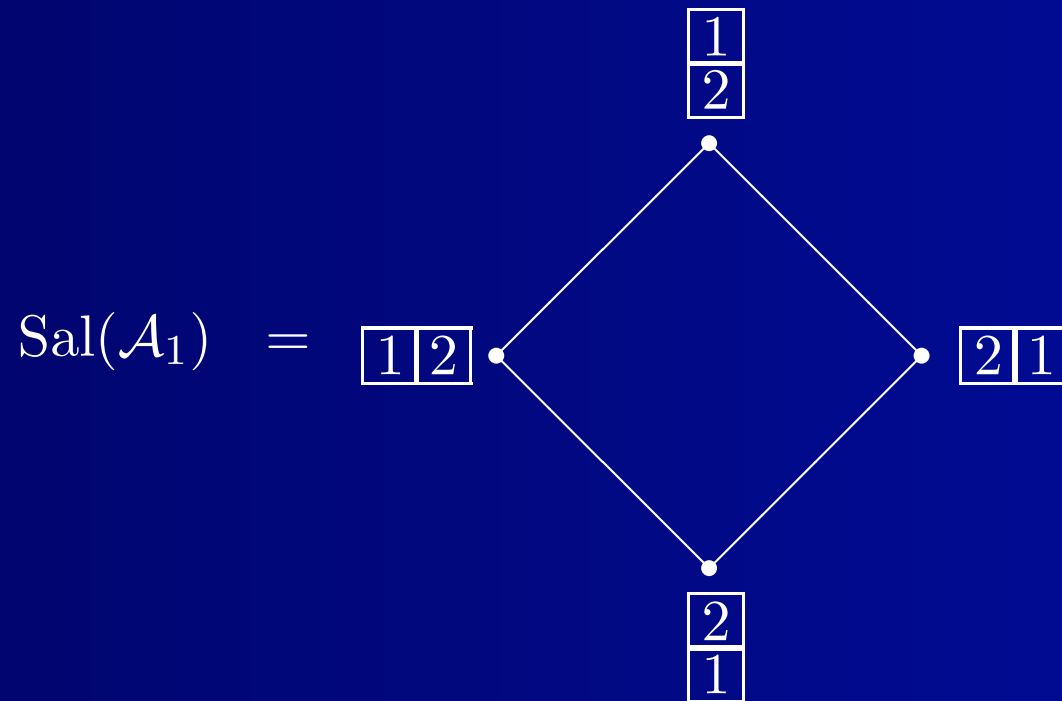

where

- for each $1 \leq i \leq j - r$, S_i is a vertically stacked squares of length $|\lambda^{-1}(i)|$, and
- labels in squares in S_i are given by $\lambda^{-1}(i)$ ordered by σ from the bottom to the top.

Consider the cell

$$\begin{array}{|c|} \hline 2 \\ \hline 1 \\ \hline \end{array} \in C_1(\text{Sal}(\mathcal{A}_1)).$$

We have

$$\begin{array}{|c|} \hline 2 \\ \hline 1 \\ \hline \end{array} \otimes x_{2n-1}^2 \in C_1(\text{Sal}(\mathcal{A}_1)) \otimes_{\Sigma_2} \tilde{H}_*(S^{2n-1}; \mathbb{F}_2)^{\otimes 2} \in E_{-1,*}^1.$$

The d^1 -differential is

$$\begin{aligned} d^1\left(\begin{array}{|c|} \hline 2 \\ \hline 1 \\ \hline \end{array} \otimes x_{2n-1}^2\right) &= \begin{array}{|c|c|} \hline 1 & 2 \\ \hline \end{array} \otimes x_{2n-1}^2 + \begin{array}{|c|c|} \hline 2 & 1 \\ \hline \end{array} \otimes x_{2n-1}^2 \\ &= \begin{array}{|c|c|} \hline 1 & 2 \\ \hline \end{array} \otimes x_{2n-1}^2 + \begin{array}{|c|c|} \hline 1 & 2 \\ \hline \end{array} \otimes x_{2n-1}^2 \\ &= 2 \begin{array}{|c|c|} \hline 1 & 2 \\ \hline \end{array} \otimes x_{2n-1}^2 \\ &= 0. \end{aligned}$$

Classical Computation with EMSS

■ Consider

$$E^2 = \text{Cotor}^{H_*(\Omega S^{2n+1}; \mathbb{F}_2)}(\mathbb{F}_2, \mathbb{F}_2) \implies H_*(\Omega^2 S^{2n+1}; \mathbb{F}_2).$$

- $H_*(\Omega S^{2n+1}; \mathbb{F}_2) \cong \mathbb{F}_2[x_{2n}]$ as primitively generated Hopf algebras.
- $\text{Cotor}^{\mathbb{F}_2[x_{2n}]}(\mathbb{F}_2, \mathbb{F}_2) \cong \text{Ext}^{(\mathbb{F}_2[x_{2n}])^*}(\mathbb{F}_2, \mathbb{F}_2)$.
- As algebras

$$(\mathbb{F}_2[x_{2n}])^* \cong \bigotimes_{a \geq 0} \mathbb{F}_2[(x_{2n}^{2^a})^*] / (((x_{2n}^{2^a})^*)^2).$$

- $\text{Ext}^{\mathbb{F}_2[y]/(y^2)}(\mathbb{F}_2, \mathbb{F}_2) \cong \mathbb{F}_2[\tau(y)]$. ($\deg \tau(y) = \deg y - 1$.)
- $E^2 \cong \mathbb{F}_2[\tau((x_{2n}^{2^a})^*) \mid a \geq 0] \cong E^\infty \cong H_*(\Omega^2 S^{2n+1}; \mathbb{F}_2)$ as algebras.

Theorem. For any homology theory $h_*(-)$, we obtain a strongly convergent spectral sequence

$$E^1 \cong \bigoplus_j C_* \left(\text{Sal}^{(n-1)}(\mathcal{A}_{j-1}) \right) \otimes_{\Sigma_j} \tilde{h}_*(X^{\wedge j}) \implies h_*(\Omega^n \Sigma^n X).$$

Spectral Sequence

- When $h_*(-)$ is multiplicative and satisfies the strong form of the Künneth formula, the E^1 -term is a functor of $\tilde{h}_*(X)$,

$$E^1 \cong \bigoplus_j C_*(\text{Sal}^{(n-1)}(\mathcal{A}_{j-1})) \otimes_{\Sigma_j} \tilde{h}_*(X)^{\otimes j}.$$

Cohen-Kamiyama Conjecture

Conjecture (F. Cohen-Kamiyama, math/0611732). *Let p be an odd prime. The inclusion of arrangements*

$$i_k^p : \mathcal{A}_{k-1} \hookrightarrow \mathcal{C}_{k-1}^p$$

induces an isomorphism

$$i_k^p : H_*(M_p(\mathbb{C}, k)/\Sigma_k; \mathbb{F}_p(\pm 1)) \xrightarrow{\cong} H_*(F(\mathbb{C}, k)/\Sigma_k; \mathbb{F}_p(\pm 1)).$$

- If the conjecture were to be true, $P^{2np+1}(p) = S^{2np} \cup_p e^{2np+1}$ retracts off from $\Sigma^2 \Omega^2 S_{(p)}^{2n+1}$ for an odd prime p .
- This is the main conjecture in Gray's program (Trans. A.M.S. 1993) of unstable homotopy theory of Moore spectra à la Cohen-Moore-Neisendorfer.

- $M_p(\mathbb{C}, k) \hookrightarrow F(\mathbb{C}, k)$?
- We have the following inclusions

$$\mathcal{A}_{k-1} = \mathcal{C}_{k-1}^1 \subset \mathcal{C}_{k-1}^2 \subset \cdots \subset \mathcal{C}_{k-1}^{\lfloor \frac{k}{2} \rfloor} \supset \cdots \supset \mathcal{C}_{k-1}^{k-1} = \mathcal{A}_{k-1}.$$

- If $p < \frac{k}{2}$,

$$\mathcal{A}_{k-1} = \mathcal{C}_{k-1}^1 \subset \mathcal{C}_{k-1}^2 \subset \cdots \subset \mathcal{C}_{k-1}^p \subset \cdots \subset \mathcal{C}_{k-1}^{\lfloor \frac{k}{2} \rfloor}.$$

- If $k > p > \frac{k}{2}$, $\mathcal{C}_{k-1}^p = \mathcal{C}_{k-1}^{k-p}$

Experimental Calculations: odd primary case

- If $p = 3$ and $k = 4$,

$$\mathcal{A}_3 = \mathcal{C}_3^1 \subset \mathcal{C}_3^2 \supset \mathcal{C}_3^3 (= \mathcal{A}_3)$$

- The map

$$\begin{aligned} H_*(M_2(\mathbb{C}, 4)/\Sigma_4; \mathbb{F}_3(\pm 1)) &\cong H_*(\text{Sal}(\mathcal{C}_3^2)/\Sigma_4; \mathbb{F}_3(\pm 1)) \\ &\longrightarrow H_*(\text{Sal}(\mathcal{C}_3^1)/\Sigma_4; \mathbb{F}_3(\pm 1)) \\ &\cong H_*(F(\mathbb{C}, 4)/\Sigma_4; \mathbb{F}_3(\pm 1)) \end{aligned}$$

is not an isomorphism.

- \mathcal{C}_3^2 doesn't behave very well.
- But we don't need \mathcal{C}_3^2 in order to go from \mathcal{C}_3^3 to \mathcal{C}_3^1 .

Experimental Calculations: $p = 3$ and $k = 4$

Theorem.

$$H_i(\text{Sal}(\mathcal{C}_3^2)/\Sigma_4; \mathbb{F}_3(\pm 3)) \cong \begin{cases} 0, & i = 0 \\ \mathbb{F}_3, & i = 1 \\ \mathbb{F}_3 \oplus \mathbb{F}_3, & i = 2 \\ \mathbb{F}_3, & i = 3. \end{cases}$$

Note that

$$H_i(\text{Sal}(\mathcal{C}_3^1)/\Sigma_4; \mathbb{F}_3(\pm 3)) \cong \begin{cases} 0, & i = 0 \\ \mathbb{F}_3, & i = 1 (\beta Q_1(x)x) \\ \mathbb{F}_3, & i = 2 (Q_1(x)x) \\ 0, & i = 3. \end{cases}$$
