Spring Prize Winner		
向 井 茂 (京大数理研)	代数多様体とその対称性 —K3 曲面とその仲間達を中心に—	
Shigeru Mukai (Kyoto Univ.)	Algebraic varieties and their symmetry with emphasis on K3 surfaces and their companions	

概要 There are many phenomena where algebraic geometry and group theory interplay. Algebraic varieties often have apparent or hidden symmetry such as the Schlafli configuration of 27 lines on a cubic surface or ADE-type degeneration of elliptic curves. In 80s I classified finite groups acting symplectically on a K3 surface, in terms of the Mathieu group M24, one of the 26 sporadic finite simple groups. In 90s Kondo determined the (infinite) automorphism group of generic Jacobian Kummer surfaces using the Higman–Sims(or Menser) graph. Besides these topics, I will also discuss recent results on the decomposition groups of certain plane curves and a conjecture on the virtual cohomological dimension of the automorphism groups if time permits.

企 画 特 別 講 演

3月16日(月)

第V会場

堀 山 貴 史 (北 大 情 報) 多面体の展開と折り (13:00~14:00)

Takashi Horiyama (Hokkaido Univ.) Folding and unfolding of polyhedra

概要 A development of a polyhedron is a simple polygon obtained by cutting the surface of the polyhedron and unfolding it into a plane. In this talk, we focus on the problems related to the following two big issues:

- (1) Does every convex polyhedron have a nonoverlapping development?
- (2) Are there any common developments for two (or more) polyhedra?

第IX会場

藤 田 博 司 (愛 媛 大 理) 超限順序数と連続体問題 $\cdots \cdots (13:00 \sim 14:00)$

Hiroshi Fujita (Ehime Univ.) Transfinite ordinals and the continuum problem

概要 We will explain how Georg Cantor introduced transifinite ordinals into mathematics. From this point of view, we also explain Cantor's continuum problem. The problem can be understood as the question asking how the continuum is well-ordered. We review some known results about definable well-ordering of the continuum.

富 安 亮 子 (九 大 I M I) 数理結晶学における格子の問題 · · · · · · · · · · · · · · · · · · (13:00~14:00) Ryoko Oishi-Tomiyasu (Kyushu Univ.) Lattice problems in mathematical crystallography

概要 The concept of lattices was originally introduced and studied by August Bravais in botany and crystallography. Nowadays, lattice problems are also studied for lattice-based crystallography, an important candidate for post-quantum cryptography. In such application, to what extent can abstract results in pure mathematics be useful? Starting from the pioneer works of Bravais, I'd explain about several problems in modern crystallography and examples for actual use of number theory I have obtained so far.

第Ⅱ会場

栗 林 勝 彦 (信 州 大 理) 導来ストリングトポロジー —分類空間の2次元開閉位相的場 の理論へ— ・・・・・・・・・・・・・・・・・・・・・・・(13:00~14:00)

Katsuhiko Kuribayashi (Shinshu Univ.) Derived string topology —Toward a two dimensional openclosed topological quantum field theory for classifying spaces—

概要 String topology introduced by Chas and Sullivan gives fruitful structures to the loop homology of orientable closed manifolds, more general Gorenstein spaces whose class contains Poincaré duality space, classifying spaces and Borel constructions. In particular, a result due to Chataur and Menichi asserts that the loop homology of the classifying space of a Lie group is endowed with the structure of a two dimensional topological quantum field theory (TQFT). Guldberg has proved that such a structure is generalized to that of a labeled open-closed TQFT. However, there are few calculations of labeled cobordism operations in the theory. In this talk, after recalling the original string topology and derived one due to Félix and Thomas, we survey computations of string operations for the classifying space of a Lie group. Moreover, we consider the non-triviality of the whistle cobordism operation with a label in the set of maximal rank subgroups of the given Lie group. It turns out that the open TQFT and closed one are not separated in general. A part of this talk is based on joint work with Luc Menichi and Takahito Naito.

特別招待講演(日本応用数理学会)

概要 In recent years, research on public key cryptosystems, which are expected to be secure against attacks using quantum computers called post-quantum cryptography (PQC), has been actively conducted. In this talk, I am going to talk about an overview of the recent research in post-quantum cryptography.

第 VIII 会場

小 林 和 夫 (早 大 教 育) 確率偏微分方程式の kinetic 方程式論的考察 · · · · · · · · · (13:00~14:00) Kazuo Kobayasi (Waseda Univ.) A kinetic approach to stochastic partial differential equations

概要 We study some stochastic partial differential equations, in particular stochastic scalar conservation laws on a bounded domain. We see that these equations appear in the hydrodynamical limit of a stochastic kinetic equation where the interactions in velocity are modelled by a nonlinear operator (Bhatnager-Gross-Krook) or a linear operator (Linear Boltzmann or Fokker-Planck). Moreover we drive a stochastic kinetic equation from the stochastic differential equation called the Langevin equation: Consider the motion of a particle with the position X(t) and the velocity V(t). We assume that (X(t),V(t)) satisfies the Langevin equation which is interpreted as Newton's second law of motion applied to the position X(t). Then the stochastic kinetic equation is satisfied with the density function f(t,x,v), with respect to the Lebesgue measure dxdv, of the conditional law of (X(t),V(t)). Finally we treat the stochastic scalar conservation laws obtained above. We discuss them on a bounded domain. First, we consider a more general equation, that is a quasilinear degenerate parabolic stochastic partial differential equation with a multiplicative noise on the N-dimensional torus. We propose to construct a sequence of approximations by applying a time splitting method and prove that this converges to a kinetic solution. Secondarilly, we discuss a stochastic scalar conservation law with non-homogeneous Dirichlet boundary condition. By introduction a notion of renormalized kinetic solutions in which the kinetic defect measures on the boundary of a domain are truncated, we establish a result of well-posedness of renormalized kinetic solutions.

George Boolos' "The Hardest Logic Puzzle Ever" revisited
_	// / / / / / / / / / / / / / / / / / /	10

5 Kenetsu Fujita (Gunma Univ.) George Boolos' "The Hardest Logic Puzzle Ever" revisited

概要 Following R. Smullyan, G. Boolos posed the puzzle "The Hardest Logic Puzzle Ever" (1996), and provided an answer in the form of "iff". After that, Roberts (2001) and Rabern-Rabern (2008) showed a simple solution to the puzzle by using the embedded question lemma. We introduce a formalization of such Knights and Knaves puzzles in term of propositional logic, and observe that the two answers by Boolos and Roberts-Rabern are essentially logically equivalent. This elegant method can be applied to an analysis of the puzzle in the fantasy film Labyrinth as well.

	Takahiro Sek	i (Niigata Univ.)	A Gentzen-style formulation for involutive substructural logics with con-	
			traposition	

概要 Involutivity, called double-negation axiom in classical logic, is one of the important additional axioms to intuitionistic substructural logics. In this talk, we consider a Gentzen-style formulation for some involutive non-associative substructural logics and show the cut elimination theorem. The logics in our formulation include contraposition axiom, regarded as a restricted associativity.

概要 By incorporating the Jónsson-Tarski Theorem with the Rasiowa-Sikorski Lemma, Tanaka-Ono gives an embedding which preserves countably many infinitary meets and joins, from every modal algebra which satisfies certain conditions including a weaker form of complete additivity into the complex algebra of a subframe of the prime filter Kripke frame. In this talk, we give another representation for modal algebras without assuming complete additivity. We show that for every modal algebra, there exists an embedding preserving countably many infinitary meets and joins into the complex algebra of a subframe of the prime filter neighborhood frame.

8 <u>大 川 裕 矢</u> (千葉大融合理工) 部分保存的な文に対する Bennet の結果の一般化 ······ 15 倉 橋 太 志 (木更津工高専)

<u>Yuya Okawa</u> (Chiba Univ.) Generalizations of Bennet's result on partially conservative sentences Taishi Kurahashi (Nat. Inst. of Tech., Kisarazu Coll.)

概要 A sentence φ is said to be Γ -conservative over T if for every Γ sentence θ , if $T + \varphi \vdash \theta$, then $T \vdash \theta$. For $\Gamma = \Sigma_n$ (resp. Π_n), let $\Gamma^d = \Pi_n$ (resp. Σ_n). In 1979, Guaspari asked that for any reasonable sequence $\{T_i\}_{i\in\omega}$ of theories, whether there is a Γ^d sentence which is simultaneously independent and Γ -conservative over each T_i . For two theories, this problem was investigated by Bennet. He completely characterized the existence of simultaneously independent and Σ_n -conservative Π_n sentences over two theories.

We generalized Bennet's results to the case of theories more than two.

14:15~15:00

概要 Legendre issues Traite des fonctions elliptiques et des *integrales euleriennes*, in 1825. In this books he discusses Eulerian Integral with two sorts of integrals, in relation to Euler's integrals, including his elliptic functions. Legendre complains Euler's integral, saying "they have never been occupied to make the calculation easy, nor to fix the degree of precision of which it is susceptible," ($\S169$) and proposes that some functions are explained with the arcs of circle and of the logarithms. ($\S60, etc.$)

(Res. Workshop of Classical Fluid Dynamics)

概要 In 1825, Legendre defines as the most important function among his elliptic functions, the complete function (=c.f.) F^1 , E^1 , Π^1 . Afterward in modern times, these functions are newly expressed with K, E and Π such as in the study of a quantum mechanics, where it shows as $F^1 = K$. We call E and Π c.f.s of newly defined versions, then $E = E^1$, $\Pi = \Pi^1$. Legendre uses the c.f. in variously applied arena, such as Geometry, Mechanics, Construction of the Tables, Eulerian Integrals, etc. We discuss the c.f. as the original by Legendre, his objects, effects, and so on.

概要 The year 2022 has various meaning for mathematics, mathematical history and mathematical education: the 314th year after his death of SEKI Takakazu (?-1708), the 400th year after the publication of Division-Instruction (Wariznsyo), the 300th anniversary of TAKEBE Katahiro's Tetsujjutsu-Sankei, and so on. We describe research problems towards the year.

15:15~16:15 特別講演

高瀬正仁 西欧近代の数学におけるさまざまな泉の造型

Masahito Takase Shaping the fountains in Modern Western Mathematics

概要 There are several impressive fountains in the history of the mathematics on which Modern Western Mathematics is founded as follows: Descartes's method of normals, Fermat's method of tangents, Fermat's number theory, Leibniz's analysis of the infinity, Johann Bernoulli's beautiful formula $\frac{\log \sqrt{-1}}{\sqrt{-1}} = \frac{\pi}{2}$, Euler's observation on dividing 0 by 0, Euer's discovery of the concept of function, Gauss' idea of transfering number theory from rational integers to Gaussian integers, The concept of an Abelian equation discovered by Abel, Kronecker's "Jugendtraum", Kummer's idea of ideal prime factors, Jacobi's inverse problem of Abelian integrals invented by Jacobi, Riemann's idea of Riemann surfaces, Hartogs' inverse problem invented by K. Oka.

I will explain the significances of returning to the fountains and make a critical observation on comtemporary mathematics.

12 只木孝太郎 (中 部 大 工) アルゴリズム的ランダムネスによる量子情報理論の精密化 III · · · · · · · · 15 Kohtaro Tadaki (Chubu Univ.) A refinement of quantum information theory by algorithmic randomness

概要 The notion of probability plays a crucial role in quantum mechanics. It appears as the Born rule. In modern mathematics which describes quantum mechanics, however, probability theory means nothing other than measure theory, and therefore any operational characterization of the notion of probability is still missing in quantum mechanics. In our former works, based on the toolkit of algorithmic randomness, we presented an operational refinement of the Born rule, called the principle of typicality, for specifying the property of the results of quantum measurements in an operational way. In this talk, we refine and reformulate the theory of quantum error-correction based on the principle of typicality, in order to demonstrate how properly our framework works in practical problems in quantum mechanics.

鈴 木 信 行(静 岡 大 理) 中間述語論理における選言特性と存在特性

Nobu-Yuki Suzuki (Shizuoka Univ.) Disjunction and existence properties in intermediate predicate logics

概要 We discuss relationships between the disjunction property (DP) and existence property (EP) in intermediate predicate logics. These properties are regarded as characteristics of constructivity of intuitionistic logic. Since existence-quantifier could be written as powerful (possibly infinitary) disjunction, we expected that there must be some relationship between them. They are, however, indepedent in intermediate predicate logics. This result contrasts with those e.g., in intuitionistic and modal arithmetic, and also gives a negative answer to Ono's problem P52 posed in 1987. The key is the quantifier-annihilation axiom Z. This axiom is abnormal in intermediate logics; but it works when we discuss DP and EP in superintuitionistic predicate logics. We introduce a condition, Z-normality, that excludes the Z and is a natural condition for reasonable logics. Then, we can show that EP implies DP for Z-normal logics. This result suggests a reason why Ono's problem P52 has remained open. We also report some recent results related to DP and EP.

Shuhei Kamioka (Kyoto Univ.) nomial

概要 Plane partition is a two-dimensional array of nonnegative integers which is not increasing in rows and columns. Recently, some new generating functions of plane partitions are studied in view of orthogonal polynomials and integrable systems. We use Kamioka's framework that interpret biorthogonal polynomials in terms of lattice paths and derive some combinatorial identities that generalizes the generating functions derived by MacMahon and Stanley.

Kenichiro Tanabe (Hokkaido Univ.) Representations of some fixed point subalgebra of the vertex algebra associated to a non-degenerate even lattice

概要 The notion of a vertex algebra was introduced by Borcherds in 1986 and is a mathematically precise algebraic counterpart of the concept of a 2-dimensional conformal field theory in physics. The vertex algebra V_L associated to a non-degenerate even lattice L is a basic example of a vertex algebra. In this talk, we discuss the fixed point subalgebra V_L^+ of V_L under the action of the automorphism of V_L induced from the -1 symmetry of L. The fixed point subalgebras play an important role in the study of vertex algebras, particularly in the construction of interesting examples. For example, the moonshine vertex algebra V_L^+ is constructed from V_L^+ and its irreducible module where Λ is the Leech lattice.

When L is positive definite, the representations of V_L^+ have been intensively studied. However, when L is not positive definite, little is known about the representations of V_L^+ so far. I will talk about the classification of irreducible weak V_L^+ -modules for any non-degenerate even lattice L.

15:30~16:50

- - 概要 In this talk, we define the affine super Yangian $Y_{\varepsilon_1,\varepsilon_2}(\widehat{\mathfrak{sl}}(m|n))$ with a coproduct structure. We also obtain an evaluation homomorphism, that is, an algebra homomorphism from $Y_{\varepsilon_1,\varepsilon_2}(\widehat{\mathfrak{sl}}(m|n))$ to the completion of the universal enveloping algebra of $\widehat{\mathfrak{gl}}(m|n)$.
- - 概要 The original modular moonshine conjectures of Ryba asserted the existence of vertex algebras over finite fields with finite group actions, such that the graded Brauer characters are genus zero modular functions. Borcherds and Ryba reinterpreted the conjectures in terms of Tate cohomology of a prime order element of the monster acting on an integral form of the monster vertex algebra. In this talk, I shall briefly explain the modular moonshine conjectures and consider generalized modular moonshine for any element of the monster group.
- - 概要 We briefly describe the construction of a self-dual integral form of the "Moonshine Module" vertex operator algebra that has Monster symmetry. This construction resolves the last open assumption in Borcherds and Ryba's proof of the Modular Moonshine conjectures. As a corollary, we obtain a positive definite unimodular lattice of rank 196884 with a faithful Monster action.

	Yoshiharu Shibata (Yamaguchi Univ.) Isao Kikumasa (Yamaguchi Univ.) Yosuke Kuratomi (Yamaguchi Univ.)	On dual square full modules

概要 A module M is said to be dual square free if, for any nonzero module N, there are no epimorphisms from M to N^2 . Oppositely, a module M is called dual square full if, for any proper submodule X of M, there exist a proper submodule Y of M containing X and an epimorphism from M to $(M/Y)^2$. We will give a decomposition of quasi-discrete modules using the concepts "dual square free" and "dual square full", and show a condition for a quasi-discrete module to be quasi-projective as its application.

	Ayako Itaba (Tokyo Univ. of Sci.)	On finite generations over centers of non-commutative projective schemes

概要 In this talk, for generic 3-dimensional quadratic AS-regular algebras $A = \mathcal{A}(E, \sigma)$, we show that a non-commutative projective schemes $\mathsf{Proj}_{\mathsf{nc}}A$ associated to A is finitely generated over its center if and only if the norm $\|\sigma\|$ of σ is finite. This result is a generalization of Mori's result for a 3-dimensional quadratic AS-regular algebra of Type S.

associated to 3-dimensional quadratic AS-regular algebras

21 松 野 仁 樹 (静 岡 大 理) 点スキームが楕円曲線である 3 次元 quadratic AS 正則環の分類 · · · · · · 10 Masaki Matsuno (Shizuoka Univ.) The classification of 3-dimensional quadratic AS-regular algebras whose point schemes are elliptic curves

概要 It is known that there is a one-to-one correspondence between 3-dimensional quadratic AS-regular algebras and regular geometric pairs. In this talk, we give a complete list of regular geometric pairs which correspond to 3-dimensional quadratic AS-regular algebras whose point schemes are elliptic curves in \mathbb{P}^2 up to isomorphism.

22	Ji-Wei He		Hopf dense Galois extensions over a ring · · · · · · · 10
	(Hangzhe	ou Normal Univ.)	
	<u>Haigang Hu</u>	(静岡大創造科学技術)	
	Ji-Wei He (Hang	zhou Normal Univ.)	Hopf dense Galois extensions over a ring
	Haigang Hu	(Shizuoka Univ.)	

概要 Let R be a commutative domain, let H be a Hopf R-algebra which is a finitely generated free R-module, and let A be an R-algebra which is also an H-comodule algebra. We will say that A/A^{coH} is a Hopf dense Galois extension if the cokernel of the associated canonical map $\beta: A \otimes_{A^{coH}} A \to A \otimes_R H$ is quotient finite. It is a generalization of a Hopf dense Galois extension over a field. A weaker version of Auslander theorem holds for Hopf dense Galois extensions over R. We also give a sufficient condition for that the localization of H is dual to a finite dimensional group algebra over an algebraic closed field containing R.

概要 Classification of thick subcategories has been one of the main approaches in the studies of triangulated categories. It has been studied so far in many areas. In this century, a beautiful theory, called tensor-triangular geometry, is initiated by Balmer. He defined a topological space for a given tensor-triangulated category. Using this topological space, he classified radical thick tensor ideals and this result enables us to do algebro-geometric studies of tensor-triangulated categories. However the Balmer theory is successful, it does not work for triangulated categories that are not tensor triangulated. Such triangulated categories include two of the most important triangulated categories in commutative algebra: the bounded derived category and the singularity category of a commutative noetherian ring. In this talk, I will introduce a way to construct spectra for (not necessarily tensor) triangulated categories and give applications to commutative algebra.

Ayana Hirano (Kitami Inst. of Tech.) Matching numbers and dimension of edge ideals Kazunori Matsuda

(Kitami Inst. of Tech.)

概要 We determine the relationship between the induced matching number, the minimum matching number, the matching number and the dimension of edge ideals.

概要 Let R be a commutative ring and M an R-module. The ideal $\sum_{\varphi \in \operatorname{Hom}_R(M,R)} \varphi(M)$ is called the trace of M. It is known that if R is a Cohen–Macaulay local ring with a canonical module ω , then the trace of ω is a defining ideal of non-Gorenstein locus of R. In this talk, we state a criterion of a given Laurent monomial is a member of the radical of the trace of the canonical module of the Ehrhart ring of the order polytope (resp. chain polytope).

 $\underline{\text{Akihiro Higashitani}}$ (Osaka Univ.) — Toric ideals of generalized permutohedra Hidefumi Ohsugi

(Kwansei Gakuin Univ.)

概要 In this talk, we discuss the toric ideals of generalized permutohedra. More precisely, we prove that the toric ideal of Minkowski sum of unit simplices has a squarefree initial ideal and is generated by quadratic binomials. Moreover, we also prove that Minkowski sums of unit simplices have the integer decomposition property. Those results are a partial contribution to Oda conjecture and Bøgvad conjecture.

概要 Reflexive polytopes have been studied from viewpoints of combinatorics, commutative algebra and algebraic geometry. A nef-partition of a reflexive polytope \mathcal{P} is a decomposition $\mathcal{P} = \mathcal{P}_1 + \cdots + \mathcal{P}_r$ such that each \mathcal{P}_i is a lattice polytope containing the origin. Batyrev and van Straten gave a combinatorial method for explicit constructions of mirror pairs of Calabi–Yau complete intersections obtained from nef-partitions. In this talk, by means of Gröbner basis techniques, we give a large family of nef-partitions arising from unimodular configurations.

概要 In this talk, given an arbitrary integer d > 0, we construct a homogeneous ideal I of the polynomial ring $S = K[x_1, \ldots, x_{3d}]$ in 3d variables over a filed K for which S/I is a Cohen–Macaulay ring of dimension d with the property that, for each of the integers $0 \le r \le d$, there exists a monomial order $<_r$ on S with $\operatorname{depth}(S/\operatorname{in}_{<_r}(I)) = r$, where $\operatorname{in}_{<_r}(I)$ is the initial ideal of I with respect to $<_r$.

概要 Let W be a finite group acting linearly on a polynomial ring R, and let $R^W \subset R$ be its invariant subring. The equivariant coinvariant ring of W is defined to be the tensor product $R \otimes_{R^W} R$; if W is a Weyl group it is isomorphic to the equivariant cohomology ring of the associated flag variety with respect to its natural torus action. In a 1976 paper, J. Watanabe obtained two important results: (1) $R \otimes_{R^W} R$ is Cohen–Macaulay if and only if W is generated by pseudo-reflections, and (2) if W is generated by pseudo-reflections then $R \otimes_{R^W} R$ is a reduced ring. In this talk, we will discuss these and other more recent related results obtained in part in collaboration with J. Watanabe and L. Smith.

概要 The notion of the principal radical system was introduced by Hochster and Eagon in 1971 and they used it to prove that the determinantal ideals are radical and Cohen–Macaulay. We will simplify the definition to prove that the Specht ideals of type (n-k,k) are radical in any characteristic and Cohen–Macaulay in characteristic zero, independent of the proofs of Yanagawa and Etingof.

概要 For a partition λ of positive integer n, let $I_{\lambda}^{\mathrm{Sp}}$ be the ideal of $R=K[x_1,\ldots,x_n]$ generated by all Specht polynomials of shape λ . It is known that if $R/I_{\lambda}^{\mathrm{Sp}}$ is Cohen–Macaulay then λ is of the form either $(n-d,1,\ldots,1),(n-d,d),$ or (d,d,1), and it is also known that the converse is true if $\mathrm{char}(K)=0.$ In this talk, we compute that the (Castelnuovo–Mumford) regularity of $R/I_{\lambda}^{\mathrm{Sp}}$, when $\lambda=(n-d,d)$ or (d,d,1). More precisely, the regularities of $R/I_{\lambda}^{\mathrm{Sp}}$ for (n-d,d) and (d,d,1) are d and d+1, respectively.

概要 The Sally module was introduced by W. V. Vasconcelos and it is useful to connect the Hilbert coefficients to the homological properties of the associated graded module of a Noetherian filtration. In this report we give a complete structure of the Sally module in the case the second normal Hilbert coefficient attains almost minimal value in an analytically unramified Cohen—Macaulay local ring. As a consequence, in this case we present a complete description of the Hilbert function of the associated graded ring of the normal filtration.

概要 For a three-dimensional extremal neighborhood $(X,C) \subset \mathbb{C}^4$ of semistable type, infinitesimal deformations of C and the abundance property contribute to the existence of three-dimensional flips for (X,C) (S. Mori, 1988). Based on these facts, the author gave an analogue of Miyaoka–Yau type inequality for (X,C) with the associated c_3 , and gave a slight generalization of such a inequality with non-trivial coefficients of c_2 , by the associated Higgs sheaves (Y. Miyaoka, 2009) and formal neighborhoods of C (M. Ebihara, 1992), for related local automorphisms. In this talk, by framed-form fans (or, T-complexes) as a toric analogue of formal scheme (M. Ishida, 1989–), the author will give: i) a concept of extremal neighborhood rigged by the framed-form fan $\Gamma := (\Gamma_a, C_a, K_a)$ associated to (X, C), denoted as (X, Γ) , ii) infinitesimal deformations of (X, Γ) by the associated Higgs sheaves, and, iii) a proto-type of characterization of Mukai–Umemura 3-folds by ii).

	Koji Nuida (Univ. of Tokyo) An elementary linear-algebraic proof for group law on elliptic curves
	概要 The group structure on the rational points of elliptic curves plays several important roles, in mathematics and recently also in other areas such as cryptography. However, the famous proofs for the group property (in particular, for its associative law) require somewhat advanced mathematics and therefore are not easily accessible by non-mathematician. This talk introduces a self-contained proof for this property, assuming mathematical knowledge only at the level of basic linear algebra and not requiring heavy computation.
35	桜 井 真 (開 智 学 園) カイラル代数の拡張と応用について
	概要 The formalism of chiral conformal field theory by Beilinson and Drinfeld was inspired by the perturbative physics of Costello, Nekrasov, and Witten. However, the progress does not acquire sufficient consensus of both mathematicians and physicists. This "chiral algebra theory" was applied from a kind of tensor category theory in the operads to cousins of vertex algebras. In the topological field theory, this theory has a "factorization algebra" theory with a sophisticated theory of higher categories. In my talk, I will report two trials of weakening the toric condition and seeking for the hidden relation to topological vertex theory.

37	安藤哲哉 (千葉 大理) 半代数多様体上の PSD 錐の理論 · · · · · · · · · 10 Tetsuya Ando (Chiba Univ.) Theory of PSD cones on semialgebraic varieties
	概要 For study of algebraic inequalities, theory of PSD (positive semidefinite) cones provides various new methods. A merits of theory of PSD cones is that we can use many results and ideas of algebraic geometry. Moreover, we can understand algebraic and geometric meanings of inequalities. For an example, we proved that the edge discriminant of cyclic homogeneous inequalities with three variables of degree d agrees with the discriminant of one variable equations of degree d . For an another example, we proved that extremal rays are determined by equality conditions. In PSD method, we determine the characteristic variety, and its critical decomposition. Irreducible components of the boundary of the PSD cone are obtained as the dual of a critical set. Using this idea, we determine extremal rays and discriminants.

概要 Recently, the author obtained a sufficient criterion for a stronger hierarchy of higher uniruledness = lower unirationality via Bott tower. In this talk, the author clarifies the following points: (1) This sufficient criterion is actually for a stronger hierarchy than the natural hierarchy arising from higher uniruledness = lower unirationality, especially from the view point of Hodge conjecture. (2) Still, this sufficient criterion has some reasonable acceptable applicability. From this reason, the author would like to call those Fano manifolds satisfying this sufficient criterion as Higher Fano manifolds.

概要 Theorem (Hoshi, Kanai and Yamasaki, arXiv:1910.01469). Let $2 \le n \le 15$ be an integer with $n \ne 12$. Let k be a field, K/k be a separable field extension of degree n and L/k be the Galois closure of K/k. Let $G = \operatorname{Gal}(L/k) = nTm$ be a transitive subgroup of S_n and $H = \operatorname{Gal}(L/K)$ with [G:H] = n. Let $T = R_{K/k}^{(1)}(\mathbb{G}_m)$ be the norm one torus of K/k of dimension n-1 and X be a smooth k-compactification of T. Then $H^1(k, \operatorname{Pic} \overline{X}) \ne 0$ if and only if G is given as in Table 1. In particular, if L/k is unramified extension, then A(T) = 0 and $H^1(k, \operatorname{Pic} \overline{X}) \simeq Sha(T)$.

Moreover, we give a necessary and sufficient condition for the Hasse norm principle for K/k where $[K:k]=n\leq 15$ and $n\neq 12$.

50 奥村喜晶(東工大理) Non-existence of Drinfeld modules with constrained torsions · · · · · · · 10 Yoshiaki Okumura (Tokyo Tech) Non-existence of Drinfeld modules with constrained torsions

概要 In the arithmetic of function fields, Drinfeld modules play the role that elliptic curves play in the arithmetic of number fields. The aim of this talk is to study a non-existence problem of Drinfeld modules with constraints on torsion points, which is motivated by a conjecture of Rasmussen and Tamagawa on abelian varieties over number fields. We prove the non-existence in the case where the inseparable degree of the base field is not divisible by the rank of Drinfeld modules. Conversely if the rank divides the inseparable degree, then we prove the existence of a Drinfeld module satisfying Rasmussen—Tamagawa-type conditions. We also prove a partial result on the Drinfeld module analogue of the uniform Rasmussen—Tamagawa conjecture.

Iwao Kimura (Univ. of Toyama) On an estimate of the relative class number of cyclotomic function field Daiki Aoyama (Univ. of Toyama) of prime conductor

概要 We first present a comparison of two upper bounds of relative class numbers of cyclotomic function fields.

We then give some explicit lower bound of the relative class number of cyclotomic function field of a prime conductor, whose constant field is the field of 3 elements.

These bounds describe the size of determinants in a class number formula of cyclotomic function fields.

概要 In 2017 Jakubec gave a formula for the relative class number of the p-th cyclotomic field, p an odd prime, by using a determinant related to the multiplication theorem for Bernoulli polynomials. We generalize his formula to an imaginary abelian number field, and we also determine the sign of the formula, which he had not given.

57	杉山和成(千葉工大) Kazunari Sugiyama (Chiba Inst. of Tech.)	概均質ゼータ関数と Katok-Sarnak 対応について 10 Prehomogeneous zeta functions and the Katok-Sarnak correspondence

概要 We discuss the Katok-Sarnak correspondence (a lifting map from Maass forms of weight 0 to those of weight 1/2) from the view point of the theory of prehomogeneous zeta functions. A key role is played by the zeta functions associated with the space of symmetric matrices of degree 2 whose coefficients involve periods of Maass wave forms. Analytic properties of these zeta functions have been investigated by Fumihiro Sato, and by using his results and a Weil-type converse theorem for Maass forms, we can construct the lifting.

並 川 健 一 (九 大 数 理) 保型形式の明示的構成とその岩澤理論への応用

Kenichi Namikawa (Kyushu Univ.) Explicit constructions of automorphic forms and its applications to Iwasawa theory

概要 The study of L-functions is one of major theme in number theory, since it is expected to include various arithmetic information. An important method for the study of L-functions is automorphic representation theory. By using elements in automorphic representations, which are called automorphic forms, we can observe connections between special values of L-functions and arithmetic phenomena. In this talk, we introduce how automorphic forms are used to study special values of L-functions. Namely, we discuss Iwasawa theoretic properties of certain L-functions of degree 4, which are called Asai L-functions, by constructing automorphic forms in an explicit way.

 Takahiko Yoshida (Meiji Univ.) Adiabatic limits, theta functions, and geometric quantization
 - 概要 In the geometric quantization of toric manifolds, Baier-Florentino-Mourão-Nunes have given a one-parameter family of compatible complex structures such that the associated Kähler polarizations converge to the real polarization determined by the moment map. One of the generalizations of the Kähler quantization to possibly non-Kähler symplectic manifolds is the Spin^c quantization. In this talk, for a non-singular Lagrangian torus fibration on a compact, complete base with prequantum line bundle and a compatible almost complex structure invariant along the fiber, we show that the Spin^c quantization converges to the real quantization by the adiabatic(-type) limit. This talk is based on arXiv:1904.04076.
- - 概要 Witten suggested that fixed-point theorems can be derived by the supersymmetric sigma model on a Riemann manifold M with potential term induced from Killing vector on M. One of the well-known fixed-point theorem is the Bott residue formula which represents intersection number of Chern classes of holomorphic vector bundles on a Kähler manifold M as sum of contributions from fixed point sets of a holomorphic vector field K on M. We derived the Bott residue formula by using topological sigma model (A-model) that describes dynamics of maps from $\mathbb{C}P^1$ to M, with potential term induced from the vector field K.
- - 概要 We discuss Hitchin–Kobayashi type correspondences for the abelian vortex equations, i.e., a certain kind of gauge theoretic equations on compact Kähler manifolds associated with linear actions of tori on complex vector spaces. The correspondence itself had already established for further general settings. Further for the abelian gauge group and linear fiber cases it is known that there exists a very simple characterization of the stability condition. We give a direct proof of the correspondences using such a simple characterization of the stability condition. The problem reduces to show the existence and the uniqueness of Kazdan–Warner type equations associated with linear actions of tori on complex vector spaces.

Yuuki Sasaki (Univ. of Tsukuba) Connectedness and homogeneity of antipodal sets

概要 Let M be a compact Riemannian symmetric space and denote the geodesic symmetry at $x \in M$ by s_x . We say that $x, y \in M$ are antipodal if $s_x(y) = y$. A subset S of M is an antipodal set if any two points of S are antipodal. An antipodal set T is called maximal if there are no antipodal sets including T properly. In this talk, we introduce a concept of connectedness of two antipodal points and antipodal sets. Using this connectedness, we construct a method to make a bigger antipodal set from a given antipodal set. Also, we construct a method to decide whether a given maximal antipodal set is homogeneous.

Mao Okada (Univ. of Tokyo) Local rigidity of certain actions of solvable groups on the boundaries of rank-one symmetric spaces

概要 We study local rigidity of certain actions of a solvable group on the boundary of a rank-one symmetric space of non-compact type, which is diffeomorphic to a sphere. When the symmetric space is a quaternionic hyperbolic space or the Cayley plane, the action we constructed is locally rigid.

Takashi Sakai (Tokyo Metro. Univ.) Natural Γ-symmetric structures on R-spaces Peter Quast (Univ. of Augsburg)

山 本 光 (東京理大理) 特殊ラグランジュ部分多様体と平均曲率流とそのミラー

Hikaru Yamamoto (Tokyo Univ. of Sci.) Special Lagrangian submanifolds, mean curvature flows and their mirror

概要 A special Lagrangian submanifold was defined by Harvey and Lawson in 1982 as a volume-minimizing Lagrangian submanifold in a Calabi-Yau manifold. Since Strominger, Yau and Zaslow in 1996 gave physical importance to special Lagrangian submanifolds in the context of mirror symmetry, special Lagrangian submanifolds have acquired much attention from both mathematicians and physicists. In 2002, Thomas and Yau conjectured that if a given Lagrangian submanifold is stable (in the sense of their paper) then the mean curvature flow starting from it exists for all time and converges to a special Lagrangian submanifold in its Hamiltonian deformation class. This is the so-called Thomas—Yau conjecture. In 2015, Joyce updated Thomas—Yau conjecture to make the statement more careful, and it is still widely open. Actually, this story is in A-side of mirror symmetry, and there is a corresponding story in B-side. The special object is a deformed Hermitian—Yang Mills connection and a way to get it is a line bundle mean curvature flow. In the former part of this talk, I would like to give an overview of recent development related to Thomas—Yau conjecture, and in the latter part, give that of studies in B-side which are rapidly developed in these several years.

概要 We introduce the notion of tiling spaces for metric space. The class of tiling spaces includes the Euclidean spaces, the middle-third Cantor spaces, and various self-similar spaces appeared in fractal geometry. On a tiling space, we characterize a metric subspace whose Assouad dimension coincides with that of the whole space.

A characterization of metric subspaces of full Assouad dimension

Yoshito Ishiki (Univ. of Tsukuba)

概要 We introduce an embedding optimization problem for a finite graph. This problem is related to an optimization problem concerning the smallest nonzero eigenvalue of the graph Laplacian. Goering—Helmberg—Wappler introduced a different embedding problem as a dual of the eigenvalue optimization problem. We establish a relation between the optimal values of the two embedding problems. It then follows that the optimal value of our embedding problem is obtained by the optimal value of the eigenvalue optimization problem. Further, we show that our embedding problem is also a dual of the eigenvalue optimization problem. We present examples of graphs for which these optimization problems can be explicitly solved.

概要 Sectional curvature is one of the most important notions in differential geometry. Statistical sectional curvature can be introduced on a statistical manifold by using the statistical curvature tensor field, which is defined as the arithmetic mean of curvature tensor fields with respect to the pair of dual connections. For a submanifold in a statistical manifold, the Euler inequality, which presents a relation between the mean curvature and the Gaussian curvature in Euclidean geometry, is generalized in terms of the statistical sectional curvature. A doubly umbilical statistical submanifold is characterized as a submanifold such that the equality holds at each point. In particular, we describe the inequality in the case where the ambient space is a standard warped product statistical manifold.

U. Pinkall (TU Berlin) Discretizing fluids into filaments and sheetsUlrich Pinkall (TU Berlin) Discretizing fluids into filaments and sheets

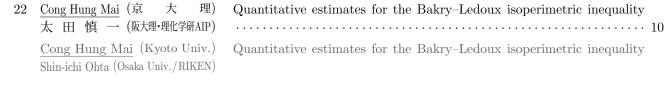

概要 In differential geometry and in mathematical physics "discretization" means replacing a continuum system (like for example a smooth surface in three-space) by a discrete collection of lower-dimensional objects (like curves or even isolated points). It is often possible to capture many important properties of the original continuum system in its discrete equivalent. In many situations relevant for physics simulation the relevant fields (vorticity of a fluid, current or magnetic field in a plasma) exhibit on their own a strong tendency to become concentrated in one-dimensional filaments or two-dimensional sheets. "Decomposing" a given continuous field into its "constituent" filaments or sheets is important for understanding and visualizing a given field. Moreover, simulation algorithms that take into account the natural tendency of the fields to become "discretized" into filaments or sheets can be highly efficient.

21 三 石 史 人 (福 岡 大 理) pエネルギーのある種のミニ・マックス値とパッキング半径 15 Ayato Mitsuishi (Fukuoka Univ.) Certain mini-max values of the p-energy and packing radii

概要 Grosjean proved that the (1/p)-th power of the first non-zero eigenvalue of the p-Laplacin on a closed Riemannian manifold converges to the twice of the inverse of the diameter of the space, when p goes to infinity. Before this being proved, Juutinen, Lindqvist and Manfredi proved a corresponding result for the Dirichlet eigenvalues. The speaker extends their results to "k-th values". More presidely, we consider "k-th diameter" as the (k+1)-th packing radius introduced by Grove-Markvorsen. Furthermore, we introduce certain min-max value related to the p-energy as a counter-part of "k-th eigenvalue." Here, please note that our min-max values are not known whether they are real eigenvalues.

概要 We establish a quantitative isoperimetric inequality for weighted Riemannian manifolds with lower weighted Ricci curvature bound. Precisely, we give an upper bound of the volume of the symmetric difference between a Borel set and a sub-level (or super-level) set of the associated guiding function (arising from the needle decomposition), in terms of the deficit in Bakry–Ledoux's Gaussian isoperimetric inequality. This is the first quantitative isoperimetric inequality on noncompact spaces besides Euclidean and Gaussian spaces. Our argument makes use of Klartag's needle decomposition (also called localization), and is inspired by the recent work of Cavalletti, Maggi and Mondino on compact spaces.

概要 Calabi and Cheng-Yau's Bernstein-type theorem asserts that an entire zero mean curvature graph in Lorentz-Minkowski (n+1)-space which admits only space-like points is a hyperplane. We give an improvement of the Bernstein-type theorem and show that an entire zero mean curvature graph in consisting only of space-like or light-like points is a hyperplane.

概要 The Atiyah—Singer index theorem states, on a closed manifold, that the analytic index of the Dirac operator, is determined by topological data. Many mathematicians have generalized this theorem, for example Kasparov proved the version of non-compact manifolds equipped with proper and cocompact group actions, in terms of non-commutative geometry. The overall goal of my research is to formulate and prove an infinite-dimensional version of this index theorem. In other words, I would like to give an equivariant index theorem for infinite-dimensional manifolds equipped with proper and cocompact actions of infinite-dimensional Lie groups, in terms of non-commutative geometry. In this talk, I will explain the results so far, focusing on the non-commutative geometrical side. Time permitting, I will mention my ongoing work which connects the results so far and some topological invariants.

概要 We give generalization of the Willmore energy for an even-dimensional closed submanifold in the Euclidean space as a residue of a meromorphic function obtained from the Riesz energy. We show that it is independent from the Graham-Witten energy when the dimension is 4.

	概要 The space of geodesic currents on a hyperbolic surface were introduced by Bonahon as a generalization of measured geodesic laminations and have been successfully studied in the case that the surface is closed or compact (possibly with boundary). One of useful properties is that the space of geodesic currents or a closed hyperbolic surface can be considered as the measure-theoretic completion of the set of weighted closed geodesics on the surface, but such a property is not shown in the case that the surface has cusped due to infinite geodesics connecting two cusps on the surface. We have proved that the space of geodesic currents on a cusped hyperbolic surface with finite area also has the same denseness property.

	概要 Over the last three decades, structure-preserving discretizations of differential geometry are rapidly developing. In particular, discretizations of surfaces are highly related to differential geometry itself

概要 Over the last three decades, structure-preserving discretizations of differential geometry are rapidly developing. In particular, discretizations of surfaces are highly related to differential geometry itself, integrable systems, complex analysis, discrete differential geometry, and so on. Bobenko-Pinkall showed that there exists a Weierstrass-type representation for discrete minimal surfaces in terms of discrete holomorphic functions. Afetrwards other Weierstrass-type representations were discovered. In this talk we introduce Weierstrass representations for discrete surfaces. A common feature of Weierstrass-type representations for discrete surfaces is that they are described by discrete holomorphic functions. We give a unified description for these representation formulae in terms of transformations for Omega-sufaces. This talk is based on joint work with Mason Pember (Politecnico di Torino) and Denis Polly (Technische Universitaet Wien).

 Masahiro Morimoto (Osaka City Univ.) Austere and arid properties for PF submanifolds in Hilbert spaces
 - 概要 Austere submanifolds and arid submanifolds constitute respectively two different classes of minimal submanifolds in finite dimensional Riemannian manifolds. In this talk we introduce these two notions into a class of proper Fredholm (PF) submanifolds in Hilbert spaces, discuss their relation and show many examples of infinite dimensional austere PF submanifolds and arid PF submanifolds in Hilbert spaces.
- - 概要 Totally umbilical submanifolds in pseudo-Riemannian manifolds are defined by the traceless part of the second fundamental form vanishing identically. They are fundamental submanifolds next to totally geodesic submanifolds. In this talk, we classify the congruent class of full totally umbilical submanifolds in non-flat pseudo-Riemannian space forms, and consider its moduli spaces. As a consequence, we obtain that some moduli spaces of isometric immersions between space forms which are of the same constant curvature are non-Hausdorff.
- - 概要 In this talk, we consider ruled real hypersurfaces in a nonflat complex space form from the viewpoint of ϕ -invariances of curvature tensors of real hypersurfaces. Furthermore we give a new characterization of these real hypersurfaces.

金 沢 篤(京 大 理) Kähler モジュライ空間と三角圏の安定性条件

Atsushi Kanazawa (Kyoto Univ.) Kähler moduli spaces and stability conditions of triangulated categories

概要 For a Kähler manifold, we can consider two moduli spaces, namely the complex moduli space and the Kähler moduli space. The former has been one of the most important subjects in modern mathematics (studied by Riemann, Kodaira-Spencer, Kuranishi and others), and beautiful theories have been developed in a variety of cases. In light of mirror symmetry, we expect that there are equivalently rich theories for the Kähler moduli spaces. However, it turns out that the Kähler structures are much more delicate than the complex structures. In this talk, I will introduce our program to investigate the Kähler moduli spaces via stability conditions of triangulated categories. Roughly speaking, we will consider a Kähler analogue of the Hodge theory.

概要 We consider random holomorphic dynamical systems on the Riemann sphere whose choices of maps are related to "Markovian" noise. Our motivation is generalizing the theory of i.i.d. random dynamical systems to our setting. We show that a generic such system is either stable on average or chaotic with full Julia set. We also talk about difference between i.i.d. and non-i.i.d. random dynamical systems.

Joe Kamimoto (Kyushu Univ.)

概要 Weierstrass gave the heat equations which characterize the elliptic sigma function. Buchstaber and Leykin succeeded in generalizing the theory of the heat equations to the sigma functions of higher genus curves. Eilbeck, Gibbons, Onishi, and Yasuda gave the detailed proof of their theory. They also gave the recurrence relations of the coefficients of series expansion of the two-dimensional sigma function. In this talk, we derive new recurrence relations of series expansion of the two-dimensional sigma function based on the heat equations. Our recurrence relations take the form in which all the parameters of the curve are included. As a corollary, we can find that the two-dimensional sigma function is characterized by a part of the heat equations.

Hidetaka Hamada Distortion theorems, Lipschitz continuity and their applications for Bloch (Kyushu Sangyo Univ.) type mappings on bounded symmetric domains in \mathbb{C}^n

概要 Let \mathbb{B}_X be a bounded symmetric domain realized as the unit ball of an n-dimensional JB*-triple $X = (\mathbb{C}^n, \|\cdot\|_X)$. In this talk, we give a new definition of Bloch type mappings on \mathbb{B}_X and give distortion theorems for Bloch type mappings on \mathbb{B}_X . As a corollary of the distortion theorem, we obtain the lower estimate for the radius of the largest schlicht ball in the image of f centered at f(0) for α -Bloch mappings f on \mathbb{B}_X . Next, as another corollary of the distortion theorem, we show the Lipschitz continuity of $(\det B(z,z))^{1/2n} |\det Df(z)|^{1/n}$ for Bloch type mappings f on \mathbb{B}_X with respect to the Kobayashi metric, where B(z,z) is the Bergman operator on X, and use it to give a sufficient condition for the composition operator C_{φ} to be bounded from below on the Bloch type space on \mathbb{B}_X , where φ is a holomorphic self

Gabriela Kohr (Babeş-Bolyai Univ.)

概要 Let Y be a complex Banach space and let \mathbb{B}_Y be the open unit ball of Y. In this talk, we consider a generalization of the Pfaltzgraff-Suffridge extension operator on bounded symmetric domains \mathbb{B}_X in \mathbb{C}^n , and show that this operator extends the first elements of Loewner chains from \mathbb{B}_X to the first elements of Loewner chains on \mathbb{D}_{α} , when $\alpha \geq n/(2c(\mathbb{B}_X))$, where $\mathbb{D}_{\alpha} \subset \mathbb{B}_X \times \mathbb{B}_Y$ is a certain domain with $\mathbb{B}_X \times \{0\} \subset \mathbb{D}_{\alpha}$ and $c(\mathbb{B}_X)$ is a constant defined by the Bergman metric on X. Next, we also show that normalized locally univalent I-Bloch mappings, which have finite trace order on \mathbb{B}_X , are mapped into R-Bloch mappings on Ω_{α} by this extension operator when $\alpha \geq 1/2$, where $\Omega_{\alpha} \subset X \times Y$ is a bounded balanced convex domain such that $\mathbb{B}_X \times \{0\} \subset \Omega_\alpha \subset \mathbb{D}_\alpha$.

松 村 慎 一 (東 北 大 理) "非負曲率"を持つ射影多様体に対する構造定理について

Shin-ichi Matsumura (Tohoku Univ.) On structure theorems for projective manifolds with certain non-negative curvature

概要 The study of certain positively curved varieties, which are often formulated with positivity of bisectional curvatures, tangent bundles, or anti-canonical divisors, occupies an important place in the theory of classification of varieties. One of the central problems in this study is to determine the structure of semi-positively curved varieties in terms of naturally associated fibrations such as Albanese maps, Iitaka fibrations, or maximally rationally connected fibrations. In this talk, I would like to discuss structure theorems for projective varieties (more generally compact Kähler manifolds) satisfying various positivity conditions. More specifically, I will explain structure theorems of maximally rationally connected fibrations for varieties satisfying the following conditions: (1) Projective manifolds with tangent bundle admitting positively curved singular hermitian metrics. (2) Projective manifolds with semi-positive holomorphic sectional curvature. (3) Projective KLT pairs with nef anti-canonical bundle. The proof is based on singular hermitian metrics on vector bundles, analytic positivity of direct image sheaves, the theory of foliations, and so on. A part of this talk is a joint work with F. Campana (Lorraine), J. Cao (Jussieu), M. Iwai (Tokyo), G. Hosono (Tohoku).

概要 We give a reflectionless inverse scattering theory on an energy dependent Schrödinger equation and, based on it, develop an inverse scattering method for an isospectral flow for the equation.

14:15~16:15

概要 We will give Lyapunov-type inequalities for a Sturm-Liouville problem of the one-dimensional p-Laplacian. In the linear case of p=2, Borg and Ha showed the Lyapunov-type inequalities by the self-adjoint property of an operator and the Green function for a boundary value problem. However, no one has ever extended those inequalities to the nonlinear case $p \neq 2$. Using another approach and the generalized trigonometric functions, we will establish those inequalities. Moreover, an inequality we obtained yields the best constant for the Sobolev embedding $W_0^{1,p} \hookrightarrow L^{\infty}$.

樹(武蔵野大工) 16 森 Parametric representation of a sheet constructed by all solution to a 藤 (早 大 理 宮 本 安 大 理) (東 数 辻 川 亨(宮 崎 大 工) 四ツ谷晶二(龍 谷 大*) Tatsuki Mori (Musashino Univ.) Parametric representation of a sheet constructed by all solution to a Kousuke Kuto (Waseda Univ.) nonlocal Allen-Cahn equation Yasuhito Miyamoto (Univ. of Tokyo) Tohru tsujikawa (Univ. of Miyazaki) Shoji Yotsutani (Ryukoku Univ.*)

概要 We are interested in the Neumann problem of a 1D stationary Allen—Cahn equation with a nonlocal term. We have obtained the global bifurcation diagram of stationary solutions, which includes the secondary bifurcation from the odd symmetric solution due to the symmetric breaking effect. Furthermore, we derives the stability/instability of all symmetric solutions. However, stability/instability of asymmetric solutions is not clarified. In this talk, we give new representation formula of a sheet consisted of all solutions to investigate stability/instability of asymmetric solutions.

概要 In this talk we consider an indefinite sublinear elliptic problem with a Robin boundary condition. We aim to provide a precise description of the positive solutions set for this problem, especially proving a global exact multiplicity result for positive solutions. Our methods rely on a priori bounds for positive solutions, the linear stability argument, bifurcation approach, and sub and supersolutions.

概要 We consider a prescribed mean curvature problem. In particular, we want to construct a surface whose mean curvature vector coincides with the normal component of a given vector field. We show that the problem has a solution near a graphical minimal surface if the prescribed vector field is sufficiently small in a dimensionally sharp Sobolev norm.

与えられた関数を平均曲率に持つ曲面の存在性について10

Existence of a prescribed anisotropic mean curvature problem

Kensuke Yoshizawa (Tohoku Univ.) Existence and non-existence of elastic graphs with the symmetric cone obstacle

概要 This talk is concerned with the variational problem for the bending energy defined on symmetric graphs under the unilateral constraint. In this talk, assuming that the obstacle function satisfies the symmetric cone condition, we prove (i) uniqueness of minimizers, (ii) loss of regularity of minimizers, and give (iii) complete classification of existence and non-existence of minimizers in terms of the size of obstacle.

坂 井 秀 隆 (東 大 数 理) Painlevé 方程式の世界

Hidetaka Sakai (Univ. of Tokyo) The world of the Painlevé equations

概要 More than a century has passed since the Painlevé equations appeared as equations that defines the special functions next to elliptic functions and hypergeometric functions. I have been studying the extension of the Painlevé equations to discrete dynamical systems or higher dimensional cases. In this talk we will see the extended world of the Painleé equations.

概要 We show Rellich inequality with sharp constant for vector valued function under solenoidal (namely divergence-free) condition. This is a continuation of the preceding work by N. Hamamoto on sharp Rellich—Leray inequality for axisymmetric divergence-free vector fields. Our main result asserts that the sharp constant can be derived without the axisymmetry condition which was used in the preceding work for technical reason. We remove such a symmetry condition and compute the best constant. Our technique is based on an appropriate $L^2(\mathbb{S}^{N-1})$ decomposition of solenoidal fields into radial and spherical directions, which does not depend on the choice of polar angular coordinates.

概要 We consider the existence and the non-existence of a minimizer of minimization problems associated with an improved Hardy—Sobolev type inequality. Only for radial functions, the improved Hardy—Sobolev inequality is equivalent to the classical Hardy—Sobolev inequality via some transformation. Therefore we completely know the existence and the non-existence of a minimizer of our minimization problem only for radial functions via the transformation. In this talk, we consider it for all functions without the transformation. Especially, in contrast to the classical results, we show the existence of a minimizer for our minimization problem with the Hardy—Sobolev critical exponent on a bounded domain.

	Aya Ishizeki (Chiba Univ.)	Upper and lower bounds and modulus of continuity of decomposed

概要 The Möbius energy is one of knot energies, and is named after its Möbius invariant property. It is known that the energy has several different expressions. One is in terms of the cosine of conformal angle, and this expression is called the cosine formula. Another is the decomposition into Möbius invariant parts, called the decomposed Möbius energy, which was proved by the authors. Hence the cosine formula is sum of the decomposed energies. There is a question. Can each of decomposed energy be estimated by the cosine formula? Here we give an affricative answer: upper and lower bound, and modulus of continuity of decomposed parts can be evaluated in terms of the cosine formula.

Takeyuki Nagasawa (Saitama Univ.) Asymptotic analysis for non-local curvature flows for plane curves with Kohei Nakamura (Saitama Univ.) general rotation number

概要 Several non-local curvature flows for plane curve with general rotation number are considered here. The flows include the are-preserving flow and the length-preserving flow. The research for the curve with the rotation number one has been well studied. In particular, when the initial curve is strictly convex, the flow converges to a circle as time to infinity. Even if the initial curve is not strictly convex, a global solution, if exists, converges to a circle. Here we deal with curves with general rotation number, and show not only a similar result for global solutions but also a blow-up criteria, estimates of the blow-up time and blow-up rate from below. We use a geometric quantity which has never been considered before.

	Mario Fuest (Paderborn Univ.) Johannes Lankeit (Paderborn Univ.) <u>Masaaki Mizukami</u>	Asymptotic behavior in a chemotaxis-consumption model with realistic boundary conditions for the oxygen	

概要 This talk considers global existence and asymptotic behavior in a chemotaxis-consumption system under realistic boundary conditions for the oxygen. In previous works a chemotaxis-consumption system under the Neumann boundary condition for the oxygen is mainly considered, and it is shown that solutions of the problem converge to constant steady states by Tao-Winkler (2012); however this result does not describe pattern formation of species. Thus it might be important to consider a chemotaxis-consumption system under realistic boundary conditions for the oxygen. This talk shows solutions of the problem converge to non-constant steady states.

蘆 田 聡 平(学習院大理) 電子のハミルトニアンの固有値の正確な下界評価

Sohei Ashida (Gakushuin Univ.) Accurate lower bounds for eigenvalues of electronic Hamiltonians

概要 Electronic Hamiltonians are differential operators depending on relative positions of nuclei as parameters. When we regard an eigenvalue of an electronic Hamiltonian as a function of relative possitions of nuclei, minimum points corresponde to shapes of molecules. Upper bounds for eigenvalues are obtained by variational methods. However, since only relative energy is relevant to the physical information as minimum points, physical information can not be obtained by variational methods only. Therefore, lower bounds are helpful for physical information to be available. In this talk we discuss the various methods for lower bounds of eigenvalues. In particular, lower bounds for eigenvalues of sums of lower semibounded self-adjoint operators are introduced. Some computations for systems of one electron and several protons are shown.

38 國 谷 紀 良 (神戸大システム情報) 異なる境界条件下での拡散を伴う SIR 感染症モデルの閾値定理 · · · · · · · 10 Toshikazu Kuniya (Kobe Univ.) Threshold theorem for an SIR epidemic model with diffusion under the different boundary conditions

概要 In this study, we are concerned with a threshold theorem for an SIR epidemic model with diffusion. We consider two different boundary conditions: (homogeneous) Dirichlet and (homogeneous) Neumann boundary conditions. We show that if the basic reproduction number \mathcal{R}_0 satisfies $\mathcal{R}_0 < 1$, then the disease-free equilibrium E_0 of the model is globally asymptotically stable, whereas if $\mathcal{R}_0 > 1$, then E_0 is unstable and a positive endemic equilibrium E^* exists under an additional condition. We show that, under the Neumann boundary conditions, \mathcal{R}_0 does not depend on the shape of the spatial domain $\Omega \subset \mathbb{R}^2$, whereas, under the Dirichlet boundary conditions, \mathcal{R}_0 depends on the shape of Ω . More precisely, we show that such \mathcal{R}_0 can attain its maximum when Ω is a square domain.

39 鄭 大 樹 (名大多元数理) The role of forward self-similar solutions in the Cauchy problem for semi-linear heat equations with exponential nonlinearity · · · · · · · · 10

Daesu Jeong (Nagoya Univ.) The role of forward self-similar solutions in the Cauchy problem for semi-linear heat equations with exponential nonlinearity

概要 In this talk, we consider the Cauchy problem for semi-linear heat equations with exponential nonlinearity. The main purpose of this talk is to prove the existence of solutions lying on the borderline between global existence and blow-up infinite time. The existence has been shown for semi-linear heat equations with power type nonlinearity. We explain the main strategy to prove the existence. By using the definition of exponential function, we approximate the solution to exponential type equation by that to power type equation. Then we can use directly the knowledge for power type equation.

概要 We obtain necessary conditions and sufficient conditions on the existence of solutions to the Cauchy problem for a fractional semilinear heat equation with an inhomogeneous term. We identify the strongest spatial singularity of the inhomogeneous term for the solvability of the Cauchy problem.

概要 We establish the local in time existence of classical solutions to the Cauchy problem of the convectiondiffusion equations in uniformly local Lebesgue spaces. For the proof, we use uniformly local $L^p - L^q$ estimate for some convolution operators and the Banach fixed point theorem.

42 <u>石 田 祥 子</u> (千 葉 大 理) Weak stabilization in Keller–Segel systems with degenerate diffusion · · 10 横 田 智 巳 (東京理大理)

<u>Sachiko Ishida</u> (Chiba Univ.) Weak stabilization in Keller–Segel systems with degenerate diffusion Tomomi Yokota (Tokyo Univ. of Sci.)

概要 We focus on stabilization in Keller–Segel systems with degenerate diffusion. As to the known studies on the non-degenerate diffusion systems, Cao (2015) and Cieślak–Winkler (2017) obtained that $u(t) \to \overline{u_0} := \frac{1}{|\Omega|} \int_{\Omega} u_0$ in $L^{\infty}(\Omega)$ as $t \to \infty$ for small initial data. Moreover, for chemtaxis-Stokes systems with degenerate diffusion, Winkler (2015) found that $u(t) \to \overline{u_0}$ weakly* in $L^{\infty}(\Omega)$ as $t \to \infty$ by using a proof by contradiction. Although their argument by contradiction actually can be applied to our system, we present the same stabilization with direct proof. Moreover our proof can be applied to chemotaxis-Navier–Stokes systems, tumor invasion systems and generalized parabolic equations with L^1 -conservation law.

Mikihiro Fujii (Kyushu Univ.) Global solutions to the dissipative quasi-geostrophic equation with dispersive forcing

概要 We consider the initial value problem for the dispersive 2D quasi-geostrophic equation with critical and supercritical dissipation $(-\Delta)^{\alpha}\theta$ (0 < $\alpha \le 1$). We establish a unique global solution for a given initial data θ_0 which belongs to the scaling subcritical Sobolev space $H^s(\mathbb{R}^2)$ ($s > 2 - \alpha$) if the size of dispersion parameter is sufficiently large. This phenomenon is so-called the global regularity. We also obtain the relationship between the initial data and the dispersion parameter, which ensures the existence of the global solution.

<u>Masaki Kurokiba</u> Singular limit problem for the Keller–Segel system and drift-diffusion (Muroran Inst. of Tech.) system

Takayoshi Ogawa

(Tohoku Univ./Tohoku Univ.)

概要 We consider a singular limit problem for the Cauchy problem of the Keller–Segel equation in a critical function space. We show that a solution to the Keller–Segel system in a scaling critical function space converges to a solution to the drift-diffusion system of parabolic-elliptic type (the simplified Keller–Segel model) in the critical space strongly as the relaxation time $\tau \to \infty$. For the proof of singular limit problem, we employ generalized maximal regularity for the heat equation and use it systematically with the sequence of embeddings between the interpolation spaces $\dot{B}^s_{q,\sigma}(\mathbb{R}^n)$ and $\dot{F}^s_{q,\sigma}(\mathbb{R}^n)$.

	Haruya Mizutani (Osaka Univ.) Xiaohua Yao (Central China Normal Univ.)	Resolvent and Strichartz estimates for fractional Schrödinger operators with Hardy potentials

概要 We discuss recent progress on uniform resolvent estimates of Kato-Yajima type and Strichartz estimates for fractional or higher-order Schrödinger operators with Hardy potentials involving subcritical coupling constants related to the best constant in the fractional Hardy inequality.

概要 In this talk, we consider global well-posedness for the wave equation with a time-dependent scale invariant damping, i.e., $\frac{2}{1+t}\partial_t u$ and a cubic convolution $(|x|^{-\gamma} * u^2)u$, where $0 < \gamma < n$. For a power type nonlinearity, the work of D'Abbicco, Lucente and Reissig shows that a critical exponent, which divides global existence and blow-up for small solutions, is shifted because of the presence of the damping term. Our aim of this work is to determine two types of critical exponents of the problem with the cubic convolution. The one is for compactly supported initial data. The second is a critical exponent about the spatial decay condition on the data.

概要 In this talk we consider the Cauchy problem of quasi-linear elastic wave equations with the strong damping term. We prove the existence of the global solution with decay property and its asymptotic profile is given by the diffusion waves as time tends to infinity. Our proof is based on the combination of the semi-group theory and the energy method.

Isao Kato (Kyoto Univ.) On the 3D Zakharov system with radial initial data
Shinya Kinoshita (Univ. Bielefeld)

概要 We study the Cauchy problem for the Zakharov system in three spatial dimensions. We prove the global well-posedness at the critical space with radially symmetric and small initial data by U^2, V^2 method introduced by Koch and Tataru. We follow the argument by Kato and Tsugawa, which was proved small data G.W.P. at the critical space for four and higher spatial dimensions. However, we need spherically symmetric data to obtain well-posedness at the critical space.

53 清 水 一 慶 (京 大 理) Local well-posedness for Schrödinger maps with helicity terms · · · · · · · 10 Ikkei Shimizu (Kyoto Univ.) Local well-posedness for Schrödinger maps with helicity terms

概要 We consider the initial-value problem for Schrödinger maps with helicity terms. We prove the local well-posedness in two different settings: the general case and the topologically-free case. In the former case, we establish local well-posedness by applying the energy method of McGahagan with improving her argument. In the later case, we show additional properties for solutions, such as blow-up criterion, quantitative bounds and difference estimates. The key idea is the reduction of the problem to a kind of nonlinear Schrödinger equation, so-called the modified Schrödinger map equation. For its analysis, the treatment for magnetic potentials is required.

概要 We consider the Cauchy problems for nonlinear Schrödinger equations with an inverse-square potential $a|x|^{-2}$ and a repulsive harmonic oscillator $-\omega^2|x|^2$. Carles (2003) proved the well-posedness and solve the scattering problems for a=0. We consider these problems for $a\neq 0$ by applying the pseudo-conformal type transform.

repulsive harmonic oscillator

Masaru Hamano (Saitama Univ.) For a stationary problem of the nonlinear Schrödinger equation with a Masahiro Ikeda (RIKEN/Keio Univ.) potential term

概要 We deal with the nonlinear Schrödinger equation with a linear potential term. First, we consider a minimization problem with respect to the elliptic equation corresponding to the NLS. In order to apply to time behavior of solutions to the NLS, the minimization problem is not characterized by the Nehari functional but the virial functional. We prove existence of a minimizer of the problem in mass-supercritical and energy-subcritical case. Then, we consider time behavior of solutions to the NLS with initial data, whose action is less than the minimum value.

概要 We consider nonlinear Schrödinger equations with double power nonlinearities. This equation has two types of standing waves. One decays exponentially, and the other only decays algebraically. In this talk, we prove instability and strong instability of standing waves including algebraic standing waves. Our results extend previous results by Ohta (1995). He studied stability/instability of standing waves with exponential decay in one-dimensional case. We improve the instability results in previous works in one-dimensional case, and moreover establish new instability results in multi-dimensional cases. The key point in our approach is to take advantage of variational characterization of algebraic standing waves.

16:30~17:30 特別講演

Kousuke Kuto (Waseda Univ.)

久藤 衡 介 (早 大 理 工) Cross-diffusion limit in the stationary SKT model

概要 This talk is concerned with the global bifurcation structure of coexistence steady-states to the Shigesada-Kawasaki-Teramoto model with cross-diffusion (so-called the SKT model). In 1999, Lou-Ni showed that the asymptotic behavior of coexistence steady-states as one of the cross-diffusion terms tends to infinity can be classified into two types (the segregation type and the shrink type). For the segregation type, the set of solutions to the corresponding limiting system (the 1st limiting system) has been revealed mainly by Lou-Ni-Yotsutani. This talk focuses on the shrink type and study the corresponding limiting system (the 2nd limiting system). We obtain the global bifurcation structure of positive solutions to the 2nd limiting system. Furthermore, by the perturbation of solutions of two limiting systems, we construct the bifurcation branch of coexistence steady-states to the SKT model in a case when one of the cross-diffusion terms is sufficiently large.

	Zhongyang Gu (Univ. of Tokyo) Yoshikazu Giga (Univ. of Tokyo)	Continuous alignment of vorticity direction prevents the blow-up of the Navier–Stokes flow under the no-slip boundary condition

概要 This talk is concerned with a regularity criterion based on vorticity direction for the Navier-Stokes equations in a three-dimensional bounded domain under the no-slip boundary condition. It asserts that if the vorticity direction is uniformly continuous in space uniformly in time, then there is no type I blow-up. A similar result has been proved for a half space by Y. Giga, P.-Y. Hsu and Y. Maekawa (2014). The difficulty of extending this result to bounded domains lies in establishing a good L^{∞} theory for the Navier-Stokes equations in a domain with curved boundary. This is achieved based on the L^{∞} theory developed by K. Abe and Y. Giga (2013).

Pen-Yuan Hsu (Univ. of Tokyo)

discontinuity of the solution map.

- 概要 The time periodic problem of the Navier-Stokes equations on a non-cylindrical space-time domain is studied. Motivated by a recent result by J. Saal (2006) on maximal regularity for this kind of system we construct time periodic solutions in L^q -spaces provided the bounded domain moves periodically with small amplitude and the given periodic external force is small. The proof is based on new decay estimates for the solution operator of parabolic evolution equations corresponding to the non-cylindrical space-time domain problem.
- - 概要 I would like to talk about the second Helmholtz decomposition in an exterior domain Ω in the N dimensional Euclidean space R^N . This decomposition is the based on the unique existence theorem for the weak Dirichlet problem. To obtain the unique existence theorem, the key is to definition of the underlying space $\hat{H}^1_{q,0}(\Omega)$.

On the isothermal compressible multi-component mixture flow: the local existence and maximal L_p - L_q regularity of solutions
 - 概要 I will talk about the local wellposedness of the isothermal compressible multi-component mixture flow in the L_p - L_q maximal regularity class. The equations are derived by the Maxwell–Stefan–Navier–Stokes theory, and the equations consist of the Navier–Stokes equations describing the compressible viscous fluid flow and diffusion equations. Since the diffusion part has 1 more unknown functions, we use the transformation of unknown functions introduced by V. Giovangigli to derive the Navier–Stokes equations coupled with a system of reaction diffusion equations. I consider the equations in a bounded domain with non-slip condition for the velocity field and homogeneous Neumann condition for the diffusion part. The proof is based on the maximal L_p - L_q regularity theorem for the linearized equations.

概要 I will talk about the L_p - L_q maximal regularity theorem for a general linear parabolic system with Neumann type boundary conditions in a uniform C^2 domain. This equations arise in a mathematical study of isothermal compressible multi-component mixture flow based on the Maxwell-Stefan theory. The proof is based on the \mathcal{R} -solver for the corresponding generalized resolvent problem and Weis' operator valued Fourier multiplier theorem.

72柴田良弘(早大理工) Yoshihiro Shibata (Waseda Univ.) On the R-solver and periodic solutions 概要 I introduce the notion of \mathcal{R} solver for the generalized resolvent problem and explain how to prove the maximal regularity theorem for the high frequency part of the periodic solutions of the system of the parabolic equations with non-homogeneous boundary conditions, which includes Stokes system with the help of the transference theorem. 柴田良弘(早大理工) Navier-Stokes 方程式の自由境界問題の周期解 · · · · · · · · · 10 Yoshihiro Shibata (Waseda Univ.) On the periodic solutions for free boundary problem of the Navier-Stokes equations 概要 I would like to talk about the existence of periodic solutions for free boundary problem of the Navier-Stokes equations. We consider the case where unknown time dependent domain is bounded close to a ball and the support of time periodic external force is in this ball. 14:15~16:15 清 水 扇 丈 (京大人間環境) 半空間での放物型方程式の初期値境界値問題に対する最大 L1 正則性 ・・ 10 小川卓克(東北大理) (Kyoto Univ.) Maximal L^1 -regularity for the parabolic initial-boundary value problem Senjo Shimizu Takayoshi Ogawa (Tohoku Univ.) in the half-space 概要 End-point maximal L^1 -regularity for the parabolic initial-boundary value problem is considered in the half-space. For the inhomogeneous boundary data of both the Dirichlet and the Neumann type, maximal L^1 -regularity for the initial-boundary value problem of parabolic equation is established in time end-point case upon the Besov space as well as the optimal trace estimates. We derive the almost orthogonal properties between the boundary potentials of the Dirichlet and the Neumann boundary data and the Littlewood-Paley dyadic decomposition of unity. 司(東北大理) 岩渕 Forward self-similar solutions for compressible Navier–Stokes equations 75P. Germain (New York Univ.) Tsukasa Iwabuchi (Tohoku Univ.) Forward self-similar solutions for compressible Navier-Stokes equations Pierre Germain (New York Univ.) 概要 We construct forward self-similar solutions for compressible Navier-Stokes equations with radial symmetry. Some of these solutions are smooth, and the others exhibit a singularity due to vacuum. 中里亮介(東北大理) Hall 効果を持つ圧縮性磁気粘性流体方程式系の解の時間大域適切性と時 川島秀 一(早大理 間減衰評価に関して 10 小川卓克(東北大理) Ryosuke Nakasato (Tohoku Univ.) Global well-posedness and time-decay estimates for the compressible Shuichi Kawashima (Waseda Univ.) Hall-magnetohydrodynamic system Takayoshi Ogawa (Tohoku Univ.)

概要 We study the initial value problem for the compressible hall-magnetohydrodynamic system (hereinafter referred to hall-MHD) in the whole space. We first focus on the solution of the linearized system that are close to some constant state $(\bar{\rho},0,\bar{B})$ with a positive constant $\bar{\rho}$ and nonzero vector \bar{B} at infinity. For general systems which include the standard linearized compressible magnetohydrodynamic system, Umeda–Kawashima–Shizuta (1984) obtained the pointwise estimates of solutions in the Fourier space. In this talk, we shall explain the results on global well-posedness and time-decay estimates for the hall-MHD around $(\bar{\rho},0,\bar{B})$. Furthermore, we shall show the pointwise estimate for the linearized hall-MHD that is the same as the result of Umeda–Kawashima–Shizuta. This is based on the joint work with Profs. Shuichi Kawashima and Takayoshi Ogawa.

Kai Koike (Keio Univ./RIKEN) Long-time behavior of a pendulum in a 1D viscous compressible fluid

概要 We consider the motion of a pendulum in a 1D viscous compressible fluid. The main theorem states that the displacement X(t) of the pendulum from the equilibrium position decays with the power law $t^{-3/2}$. This partially explains the numerically observed long-time behavior of a pendulum in the BGK gas [Tsuji and Aoki, *J. Comput. Phys.*, 250: 574–600, 2013]. The basic tool for the analysis is the pointwise estimates of Green's function as in the case of a freely moving point mass [Koike, arXiv:1904.00992, 2019]. We also need to take into account a cancellation effect due to the oscillatory nature of the problem to obtain the presumably optimal decay rate.

- - Keiichi Watanabe (Waseda Univ.) Global solvability of the Navier–Stokes–Korteweg equations with a nondecreasing pressure in L^p -framework

概要 In this talk, we consider the isentropic Navier-Stokes-Korteweg equations with a non-decreasing pressure on the whole space \mathbb{R}^d , $d \geq 2$, where the system describes the motion of compressible fluids such as liquid-vapor mixtures with phase transitions including a variable internal capillarity effect. We prove the global well-posedness of the system for small initial data belonging to $H^{s+1,q}(\mathbb{R}^d) \times H^{s,q}(\mathbb{R}^d)^d$ supposing that s > d/q if $1 < q \leq d$ and that $s \geq 1$ if $d < q < \infty$. The proof relies on the maximal regularity property for the negative of the Laplace operator.

<u>Masahiro Suzuki</u> (Nagoya Inst. of Tech.) The Morrow model of gas discharge I: Stability analysis Atusi Tani (Keio Univ.*)

概要 We study an initial boundary value problem to the Morrow model over a bounded interval. This problem has a trivial stationary solution for any voltage, which is adopted as a boundary condition. We show that there exists a threshold of voltage at which the trivial solution becomes from stable to unstable. This threshold can be understood as a sparking voltage for the happening of gas discharge.

<u>Masahiro Suzuki</u> (Nagoya Inst. of Tech.) The Morrow model of gas discharge II: Global bifurcation Walter Strauss (Brown Univ.)

概要 We consider the steady states of a gas between two parallel plates that is ionized by a strong electric field so as to create a plasma. We use global bifurcation theory to prove that there is a curve of such states with the following property. The curve begins at the sparking voltage and either the particle density becomes unbounded or the curve ends at the anti-sparking voltage.

概要 The classical Euler—Poisson system for electrons and ions, interacting through an electrostatic field, describes the motion of plasma. In a certain situation, physicists use a simpler system only for ions by assuming the Boltzmann relation. The simpler system can be derived by letting the mass ratio of an electron and an ion tend to zero. We justify this limit rigorously.

Jun-ichi Segata (Kyushu Univ.) Long time behavior of solution to the nonlinear Schrödinger equation with delta potential

概要 We summarize recent progress on long time behavior of solution to the initial-value problem for the one dimensional nonlinear Schrödinger equation with a delta potential. We first consider the case where potential is repulsive and prove that small global solutions decay in L^{∞} and exhibit (modified) scattering. Next we mention the case where potential is attractive and prove that for sufficiently small initial data, the corresponding global solution decomposes into a small solitary wave plus a radiation term that decays and scatters as $t \to \infty$. In particular, we establish the asymptotic stability of the family of small solitary waves.

17 水 上 雅 昭 (東京理大理) Uniform-in-time convergence of solutions for a chemotaxis-competition model to those for the Lotka-Volterra competition model · · · · · · · · 15

Masaaki Mizukami Uniform-in-time convergence of solutions for a chemotaxis-competition model to those for the Lotka-Volterra competition model

概要 This work is concerned with the question that "how far does small chemotactic interaction perturb the Lotka-Volterra competition dynamics?". A two-species chemotaxis-competition model was studied by e.g., Bai-Winkler (2016) and Lin-Mu-Wang (2015). However, there are still many open problems about the two-species chemotaxis-competition model. On the other hand, the Lotka-Volterra competition model has been studied extensively. Thus the development of this work will enable us to see new properties of solutions for the chemotaxis system. The main result of this talk gives uniform-in-time convergence of solutions for the two-species chemotaxis-competition system to those for the Lotka-Volterra competition model.

概要 This talk is concerned with a phase separation system deduced from the entropy balance. Both the viscous and the non-viscous cases are considered in the Cahn-Hilliard relations characterizing the phase dynamics. The entropy balance is written in terms of the absolute temperature and of its logarithm, appearing under time derivative. The initial and boundary value problem is considered for the system of partial differential equations. The existence of a global solution is proved via some approximations involving Yosida regularizations and a suitable time discretization.

Shunsuke Kurima (Tokyo Univ. of Sci.) A Cahn-Hilliard approach to a nonlinear diffusion chemotaxis system

概要 This talk deals with a nonlinear diffusion chemotaxis system. Colli-Fukao (2015) proved existence of solutions to a Cahn-Hilliard system as an approximation of a nonlinear diffusion equation by applying the abstract theory by Colli-Visintin (1990) for doubly nonlinear evolution inclusions with some bounded monotone operator and some proper lower semicontinuous convex function. Moreover, Colli-Fukao (2016) established existence of solutions to the nonlinear diffusion equation by passing to the limit in the Cahn-Hilliard equation. However, Cahn-Hilliard approaches to nonlinear diffusion chemotaxis systems seem not to be studied. This talk will try to derive existence of solutions to a nonlinear diffusion chemotaxis system by passing to the limit in a Cahn-Hilliard type chemotaxis system.

- - 概要 We consider the asymptotic limits of the time-periodic problem for the viscous Cahn-Hilliard equation with the homogeneous Dirichlet boundary condition. We already reported about the asymptotic limits of the initial value problem for the viscous Cahn-Hilliard equation. It is shown that the Cahn-Hilliard equation and the Allen-Cahn equation are derived as the asymptotic limit of the viscous Cahn-Hilliard equation and hence we show the existence of the time-periodic solutions of their equations.

Hiroshi Watanabe (Oita Univ.) Construction of traveling waves and asymptotic behavior of entropy solutions to scalar parabolic-hyperbolic conservation laws

概要 We consider one-dimensional Cauchy problems (CP) for scalar parabolic-hyperbolic conservation laws. The equation is regarded as a linear combination of the hyperbolic conservation laws and the porous medium type equations. Thus, this equation has both properties of hyperbolic equations and those of parabolic equations. Accordingly, it is difficult to investigate the behavior of solutions to (CP). In this talk, we construct discontinuous traveling waves and discuss the properties of them. Moreover, we show the asymptotic behavior of entropy solutions to (CP) using the constructed traveling waves.

概要 We deal with initial-boundary problems for Vlasov-Poisson systems in a half-space. In 2013, Skubachevskii provides local-in-time solvability to the system. Furthermore, in 2017, existence result with weaker condition were also obtained where the magnetic force is horizontal to the wall. This talk provides another result for the equation where the magnetic force has angle error in the vertical direction and depending on the first element of the spatial variable.

$14:15\sim15:55$

- - 概要 We consider nonlinear parameter-dependent evolution equations governed by double time-dependent subdifferentils in uniformly convex Banach spaces. In this talk, we investigate singular optimal control problems for doubly nonlinear parameter-dependent evolution state equations. Then, we show the existence of an optimal control for our problem.
- - 概要 We consider a class of optimal control problems for state problems of multidimensional semi-discrete systems. Each state problem is denoted by $(S)_{\varepsilon}$, with $\varepsilon > 0$, and is based on the phase-field model of grain boundary motion. In this regard, each optimal control problem is denoted by $(OP)_{\varepsilon}$, with $\varepsilon > 0$, and it is prescribed as a minimization problem of a cost function. Additionally, the problems $(S)_{\varepsilon}$ and $(OP)_{\varepsilon}$ are supposed to admit limiting profiles as $\varepsilon \downarrow 0$, and then, the limiting problems are supposed to contain no little singularities. The main interest is in the case when $\varepsilon > 0$ (regular case), and the mathematical results concerned with: (A) the existence of the optimal control when $\varepsilon > 0$; (B) the necessary condition for the regular optimal control; (C) limiting observation as $\varepsilon \downarrow 0$; will be reported as the main theorems of this talk.

概要 In this talk, we consider a one-dimensional Kobayashi-Warren-Carter type system, which is based on a phase-field model of grain boundary motion. This talk corresponds to a continuation of the last presentation at MSJ Spring Meeting 2019 (Tokyo), which was concerned with the uniqueness of special kind of solution, named "crystalline solution". On this basis, we here focus on the existence issue of crystalline solution. Through the precise observations for solutions to a time-discretization scheme, a class of structural conditions for the initial data will be presented as the sufficient condition for the existence of crystalline solution.

69 実函数論

概要 In cold regions, buildings that are exposed to extremely low temperatures undergo freezing and build microscopic ice lenses that lead to the mechanical damage of the material. In this talk, we consider a mathematical model describing swelling of a pocket of water to understand the formation of ice lenses growing inside of porous materials. Our problem is posed on a halfline with a moving boundary at one of the ends, and the moving boundary conditions encode the swelling mechanism, while a diffusion equation is responsible for providing water content for the swelling to take place. In this talk, we discuss the existence and uniqueness, large time behavior of a solution to our problem.

概要 In this talk, we will treat the Cahn-Hilliard equation with a dynamic boundary condition of Allen-Cahn type. We focus on the analysis of the surface diffusion on the dynamic boundary condition. By the asymptotic analysis, we can expect that the solution with the surface diffusion converges to the one of without the surface diffusion in a sense. The role of the surface diffusion will be expressed by means of the classes of the solutions.

33 伊藤昭夫 Approach from the quasi-variational structure to tumor invasion with non-smooth degenerate diffusion · · · · · · · · 15

Akio Ito Approach from the quasi-variational structure to tumor invasion with non-smooth degenerate diffusion

概要 We consider an initial-boundary value problem of a tumor invasion of Chaplain—Anderson type, in which the coefficient of random motility of tumor cells depends on the extracellular matrix and the diffusion flux of tumor cells is nonsmooth and degenerate. Form these points of view, the Cauchy problem considered in this talk has a quasi-variational structure and this fact makes it more difficult and complicate to analyze this model mathematically. The aim of this talk, we give the existence of local-in-time solutions by applying the general theory, which was established in the paper, Evolution inclusion on a real Hilbert space with quasi-variational structure for inner products, Journal of Convex Analysis, 26 (2019), No. 4, 1185–1252.

16:15~17:15 特別講演

(Kyoto Univ./Kyoto Univ.) forcing term via the phase field method

概要 We study the mean curvature flow with given non-smooth forcing term g. In 1993, Ilmanen proved the existence of the Brakke flow with $g \equiv 0$, by using the phase field method. Generally, the most difficult part of the proof of the existence theorem is the estimate of the positive part of the discrepancy measure. To solve the problem, Ilmanen showed the non-positivity of the discrepancy measure via the maximum principle. However, in the case of $g \not\equiv 0$, the property does not hold for the usual phase field method of the problem. In this talk, we explain a new modified Allen—Cahn equation which satisfies the non-positivity of the discrepancy measure, and we prove the existence of the weak solution for the mean curvature flow with forcing term in suitable Sobolev spaces.

 <u>Amane Kiyose</u> (Kobe Univ.) On the Mourre estimates for Floquet Hamiltonians
 Tadayoshi Adachi (Kyoto Univ.)
 - 概要 We introduce a new conjugate operator for a Floquet Hamiltonian associated with a Schrödinger operator with time-periodic potentials. Although Yokoyama (1998) already obtained a conjugate operator for the Floquet Hamiltonian, there was a difficulty that it won't afford extensions to the many-body systems. Here we introduce our new conjugate operator which suggests such extensions. Actually, combining our results and Yokoyama's, Adachi recently constructed a conjugate operator for three-body systems.

Hyeonbae Kang (Inha Univ.)Surface Riesz transforms and spectral property of the elastic Neumann—
Poincaré operator on less smooth domains in three dimensions
 - 概要 It was proved that the elastic Neumann-Poincaré operator, which is a boundary integral operator related to the Lamé system, is polynomially compact and, as a consequence, that its spectrum consists of three non-empty sequences of eigenvalues accumulating to certain numbers determined by Lamé constants, if the boundary of the domain where the operator is defined is C^{∞} -smooth. We extend this result to less smooth boundaries, namely, $C^{1,\alpha}$ -smooth boundaries for some $\alpha>0$. The results are obtained by proving certain identities for surface Riesz transforms, which are singular integral operators of non-convolution type, defined by the metric tensor on a given surface.

Eric Bonnetier (Univ. Grenoble-Alpes) planar domain with a corner Charles Dapogny (Univ. Grenoble-Alpes)

概要 Main results of this talk is a contribution to the study of the spectrum of the elastic Neumann–Poincaré operator, which is a boundary integral operator involved in the resolution of the Lamé system in a domain. Previous studies have shown that when the domain is smooth in two dimensions, the spectrum of the operator consists of two sequences of eigenvalues with accumulation points $\pm \kappa_0$, where the constant κ_0 is explicitly determined by the Lamé constants. In this talk, we focus on the situation where the planar domain is smooth except at a corner; we then prove that the elastic Neumann–Poincaré operator has essential spectrum, which contains at least two intervals around the values κ_0 and $-\kappa_0$ respectively.

	Hiroshi Inoue	e (Daiichi Univ.	of Pharm.)	Quantum dynamics based on non-self-adjoint hamiltonians	

概要 This presentation introduces a study of quantum dynamics generated from non-self-adjoint hamiltonian based on biorthogonal sequences in Hilbert space. In this study, the notion of generalized Riesz systems plays an important role. We investigate under what conditions standard self-adjoint hamiltonian and non-self-adjoint hamiltonian defined by generalized Riesz systems construct quantum dynamics. Furthermore, we investigate under what conditions generalized Riesz systems define gibbs states on a *-algebra of unbounded operators.

5 岩 田 順 敬 (関西大化学生命工) 作用素の対数表現を用いた抽象 Miura 変換 · · · · · · · · · · · · 15 Yoritaka Iwata (Kansai Univ.) Abstract Miura transform based on the logarithmic representation of operators

概要 Miura transform is known as the transformation between Korteweg—de Vries(KdV) and modified KdV (mKdV) equations. In this talk, based on the logarithmic representation of operators in Banach spaces, a structure common to both Miura and Cole—Hopf transforms is studied in an abstract manner. In conclusion, by means of the abstract version of the Miura transform in Banach spaces, an integrable class of nonlinear semigroup theory is clarified. It is the first step to pin down the correspondence of Backland transform in semigroup theory of operators.

Shuji Watanabe (Gunma Univ.) An operator-theoretical treatment of the specific heat of a superconductor in the BCS-Bogoliubov model of superconductivity

概要 In this talk we study the temperature dependence of the specific heat in the BCS-Bogoliubov model of superconductivity from the viewpoint of operator theory. We give the exact and explicit expression for $\Delta C_V(T_c)/C_V^N(T_c)$. Here, $C_V^N(T_c)$ denotes the specific heat at constant volume at the transition temperature T_c , and $\Delta C_V(T_c)$ its gap at T_c . We then show that $\Delta C_V(T_c)/C_V^N(T_c)$ does not depend on superconductors and is a universal constant.

Fumihiko Nakano (Gakushuin Univ.) Scaling limit of the eigenvalues and eigenfunctions of 1-dimensional random Schrödinger operators

概要 1-dimensional random Schrödinger operators have various spectral properties, and level statistics depending on the decay rate of the potential at infinity. Especially, the level statistics at the critical order is intimately related to the scaling limit of the Gaussian beta ensemble in the random matrix theory. In this talk, we discuss the joint scaling limit of the eigenvalues and eigenfunctions.

7	川 村 晃 英 (京 大 理) り 球表現の分解と多変数超幾何型多項式の加法定理15
	Koei Kawamura (Kyoto Univ.) Decomposition of spherical representations and an addition theorem for multivariate hypergeometric polynomials
	概要 Harmonic analysis on groups is useful to study properties of special functions which arise as zonal spherical functions. Dunkl (1976) induced an addition theorem for the Krawtchouk polynomials, which are discrete orthogonal polynomials of hypergeometric type, by decomposing spherical representations of wreath produnts of symmetric groups. We apply his method to multivariate case, that is, we use harmonic analysis on a non-Archimedean local field with a wreath products action. Then we have an addition theorem for multivariate Krawtchouk polynomials with coefficients in multivariate Hahn polynomials.
8	嵐 晃 一 (名大多元数理) 有界等質領域上の holomorphic multiplier 表現 · · · · · · · · 15 Koichi Arashi (Nagoya Univ.) Holomorphic multiplier representations for bounded homogeneous domains
	概要 We consider the unitarizations in the spaces of holomorphic sections of equivariant holomorphic line bundles over a bounded homogeneous domain under the action of the identity component of an algebraic group acting transitively on the domain. We give a complete classification of unitary representations arising from such unitarizations.
9	田内大渡(東大数理) A generalization of the uniformly bounded multiplicity theorem · · · · · · 15 Taito Tauchi (Univ. of Tokyo) A generalization of the uniformly bounded multiplicity theorem
	概要 Let H be a closed subgroup of a real reductive Lie group G and $G_{\mathbb{C}}, H_{\mathbb{C}}$ their complexifications. It was proved by T. Kobayashi and T. Oshima that the multiplicities of irreducible representations of G in the regular representation $C^{\infty}(G/H)$ are uniformly bounded iff $H_{\mathbb{C}}$ acts on the full flag variety $G_{\mathbb{C}}/B$ with finitely many orbits. In this talk, we prove that the multiplicities of the irreducible representations of G induced from a parabolic subgroup G in $G^{\infty}(G/H)$ are uniformly bounded if $G^{\infty}(G/H)$ acts on $G^{\infty}(G/H)$ with finitely many orbits using the theory of holonomic G 0.
10	久保利久 (龍谷大経済)The K-type formulas for Kable's differential operators of type A3 andB. Ørsted (Aarhus Univ.)(Ryukoku Univ.)Toshihisa Kubo (Aarhus Univ.)(Ryukoku Univ.)Bent Ørsted (Aarhus Univ.)The K-type formulas for Kable's differential operators of type A3 and Heun polynomials
	概要 In 2012, Kable introduced a one-parameter family $\mathcal{D}_n(s)$ with $s \in \mathbb{C}$ of differential operators for $\mathfrak{sl}(n,\mathbb{C})$. The operators $\mathcal{D}_n(s)$ can be thought of as $\widetilde{SL}(n,\mathbb{R})$ -intertwining differential operators between parabolically induced representations; thus, the space $Sol_n(s)$ of smooth solutions for $\mathcal{D}_n(s)$ is naturally a representation space of $\widetilde{SL}(n,\mathbb{R})$. To date, the representations realized on $Sol_n(s)$ are determined only for the case $(n,s)=(3,0)$, for which the realized representations are precisely all minimal unitary representations of $\widetilde{SL}(n,\mathbb{R})$ ([Kubo-Ørsted, 2019]). In this talk we then consider the case $(n,s)=(3,\text{general})$. We first classify the complex parameters $s\in\mathbb{C}$ with $Sol_3(s)\neq\{0\}$. We then determine the K -type formulas for the space $Sol_3(s)_K$ of K -finite solutions for $\mathcal{D}_3(s)$ by using Heun polynomials.

Ryosuke Nakahama (Univ. of Tokyo) Construction of intertwining operators for restriction of holomorphic discrete series representations

概要 Let G be a Lie group, $G' \subset G$ be a closed subgroup, and we consider a unitary representation \mathcal{H} of G. Then in general, the restriction $\mathcal{H}|_{G'}$ decomposes into a direct integral of irreducible representations of G'. Especially, if \mathcal{H} is in a nice class of representations called "holomorphic discrete series representations" and (G, G') is a "symmetric pair of holomorphic type", then $\mathcal{H}|_{G'}$ decomposes discretely, and there exist G'-intertwining operators between $\mathcal{H}|_{G'}$ and a representation \mathcal{H}' of the subgroup G' of both directions. The projection operator $\mathcal{H}|_{G'} \to \mathcal{H}'$ (the symmetry breaking operator) is always given by a differential operator, and the embedding operator $\mathcal{H}' \to \mathcal{H}|_{G'}$ (the holographic operator) is given by an infinite-order differential operator. In this talk the speaker gives some results on explicit construction of these intertwining operators in some examples.

9:45~12:00

概要 Let A and B be strictly positive operators on a Hilbert space, $n \in \mathbb{N}$ and $x, y \in \mathbb{R}$. We have defined the n-th residual relative operator entropy $\mathfrak{R}_{x,y}^{[n]}(A|B) \equiv A^{\frac{1}{2}}\Psi^{[n]}(A^{-\frac{1}{2}}BA^{-\frac{1}{2}},x,y)A^{\frac{1}{2}}$, where $\Psi^{[n]}(a,x,y) = \frac{a^y(\log a)^n}{(n-1)!} \int_0^1 (1-t)^{n-1}a^{t(x-y)}dt$ (a>0) is the residual term of the Taylor expansion of a^x around y divided by $(x-y)^n$. By using $\mathfrak{R}_{x,y}^{[n]}(A|B)$, we can show the relations among the n-th relative operator entropies or more precise properties of them.

概要 Recently, Kian and Seo had shown the Ando-Hiai type inequality with negative powers, and also Fujii and Nakamoto have given the Furuta type inequality with negative powers and its generalizations. In this talk, we show some improvement forms of their Furuta type inequalities based on properties of Furuta inequality.

	(Osaka Kyoiku Univ.)	

概要 In this talk, by virtue of an expression of matrix geometric means for positive semidefinite matrices via the Moore-Penrose inverse, we show matrix versions of the Hölder-McCarthy inequality and quasi-arithmetic power means via matrix geometric means.

14	中 山 椋 介 (大阪教育大教育) 瀬 尾 祐 貴 (大阪教育大教育) 東 條 玲 央 (大阪教育大教育)	Reverse matrix quasi-arithmetic power means via matrix geometric means
	Ryosuke Nakayama (Osaka Kyoiku Univ.)	Reverse matrix quasi-arithmetic power means via matrix geometric means
	Yuki Seo (Osaka Kyoiku Univ.)	
	Reo Tojo (Osaka Kyoiku Univ.)	

概要 In this talk, by virtue of an expression of matrix geometric means for positive semidefinite matrices via the Moore-Penrose inverse, we show matrix versions of the Hölder-McCarthy inequality, the Holder inequality and quasi-arithmetic power means via the matrix geometric means, and their reverses for positive definite matrices via the generalized Kantorovich constant

概要 In this talk, for an *n*-tuple of positive invertible operators on a Hilbert space, we investigate the monotonicity of the power mean from the deformed operator mean from an *n*-variable operator mean by an operator mean in terms of the generalized Kantorovich constants under the operator order. Moreover, we improve the norm inequality for the operator power means related to the Log-Euclidean mean in terms of the Specht ratio.

概要 The set of the positive operators on a Hilbert space forms a Riemannian (or Finsler) manifold where its geodesic is the geometric mean in the sense of Pusz-Woronowicz-Kubo-Ando. The Kubo-Ando operator mean for the non-invertible case is defined as the limit for the invertible case. But it is no longer within the geometric consideration. On the other hand, based on the geodesic of the Grassmannian, Bonnabel-Sepulchure (and Batzies-Huper-Machado-Leitesection) introduces a path of geometric means for positive semi-definite matrices with a fixed rank that coincides with the Kubo-Ando one for the invertible case (We call it BS-mean shortly). We extend any (differentiable) path of Kubo-Ando means to that of the corresponding BS means.

17 内 山 充 Operator functions and operator means · · · · · · · · · · · 15 (島根大*・立命館大総合科学技術研究機構)

Mitsuru Uchiyama Operator functions and operator means (Shimane Univ.*/Ritsumeikan Univ.)

概要 It is well-known that f(t) defined on a right half line is operator monotone if and only if f(t) is operator concave and $f(\infty) > -\infty$. This characterization does not hold if the domain of f(t) is a finite interval; for instance, an operator monotone function $\tan t$ on $(0, \pi/2)$ is not even numerically concave. We will show that f(t) > 0 is operator monotone if and only if $f(A!B) \leq f(A)!f(B)$ $(\forall A, B)$, where ! represents the operator harmonic mean.

Takeaki Yamazaki (Toyo Univ.) A generalization of the Aluthge transformation in the viewpoint of operator means

概要 The Aluthge transformation is a very famous operator transformation. It can be considered as a geometric mean of left and right multiplication operators in the finite dimensional case. In this talk, we will extend the Aluthge transformation by considering other operator means via double operator integrals.

14:15~15:10

- - 概要 We study the phase transition of KMS states for the C*-algebras of ax+b-semigroups of algebraic integers in which the multiplicative part is restricted to a congruence monoid, as in recent work of Bruce generalizing earlier work of Cuntz, Deninger, and Laca. Here we realize the extremal low-temperature KMS states as generalized Gibbs states by constructing concrete representations induced from extremal traces of certain group C*-algebras. We use these representations to compute the Murray-von Neumann type of extremal KMS states and we determine explicit partition functions for the type I factor states. The collection of partition functions that arise this way is an invariant under R-equivariant isomorphism of C*-dynamical systems, which produces further invariants through the analysis of the topological structure of the KMS state space. As an application we characterize several features of the underlying number field and congruence monoid in terms of these invariants.

(Sasebo Nat. Coll. of Tech.)

C'-algebras generated by multiplication operators and composition operators by functions with self-similar branches

概要 Let K be a compact metric space and let $\varphi: K \to K$ be continuous. We study C^* -algebra \mathcal{MC}_{φ} generated by all multiplication operators by continuous functions on K and a composition operator C_{φ} induced by φ on a certain L^2 space. Let $\gamma = (\gamma_1, \ldots, \gamma_n)$ be a system of proper contractions on K. Suppose that $\gamma_1, \ldots, \gamma_n$ are inverse branches of φ and K is self-similar. We consider the Hutchinson measure μ^H of γ and the L^2 space $L^2(K, \mu^H)$. Then we show that the C^* -algebra \mathcal{MC}_{φ} is isomorphic to the C^* -algebra $\mathcal{O}_{\gamma}(K)$ associated with γ under some conditions.

- 1 星 野 浄 生 (阪 府 大 理) On a Riemann approximation of the stochastic integral · · · · · · · · · 15 Kiyoiki Hoshino (Osaka Pref. Univ.) On a Riemann approximation of the stochastic integral
 - 概要 We introduce a Riemann-type sum regarded as generalizations of the sums which define the Nualart-Pardoux-Stratonovich integral and the Ogawa integral with respect to the Haar system, and discuss the approximation of some stochastic integrals by this sum. We attempt to characterize some stochastic integrabilities by conditions on the Riemann sum, by which we also introduce a variation of the stochastic k-integral and give an application example of this related to the volatility estimation.
- - 概要 We are concerned with an application of the theory of BPE (Brownian particle equation). More precisely, in the framework of the nonccausal stochastic calculs, we intend to show a very simple derivation of noncausal counterpart of Girsanov's theorem on the drift shift of Brownian motion.
- - 概要 In 2006, Ben Arous and Voiculescu introduced free max-convolution and free extreme values. They are analogue of classical max-convolution and classical extreme values, respectively. We expect that there is a relation between free max-probability and asymptotically eigenvalue distributions of spectral maximum of random matrices. In additive case, Bercovici and Pata in 1999 proved the equivalence of limit theorems for classical and freely (additive) infinitely divisible distributions. Based on this result, we studied limit theorems for classical and freely max-infinitely divisible distributions. In this talk, we explain a relation between classical-max and free-max.
- - 概要 We consider a generalized version of the Takagi function, which is one of the most famous example of nowhere differentiable continuous functions. We investigate a set of conditions to describe the rate of convergence of Takagi class functions from the probabilistic point of view: The law of large numbers, the central limit theorem, and the law of the iterated logarithm. On the other hand, we show that the Takagi function itself does not satisfy the law of large numbers in the usual sense.
- 5 中島由人(京大人間環境) Fractal n-gons の連結性パラメータ集合とその部分集合の連結性 15 Yuto Nakajima (Kyoto Univ.) Connectedness of connectedness locus for fractal n-gons and the remarkable subset
 - 概要 We consider the closure of the set of zeros of polynomials with complex coefficients randomly chosen from a "good" compact subset of complex plane. We prove that the closure of the set of zeros is connected. Furthermore, we apply this result to the study of connectedness locus (\mathcal{M}_n) of fractal n-gons and the remarkable subset \mathcal{M}_n^0 . Fractal n-gons and \mathcal{M}_n are introduced by C. Bandt and N. V. Hung (2008). It is already known that \mathcal{M}_2 , \mathcal{M}_2^0 and \mathcal{M}_3 are connected (T. Bousch (1988), Y. Himeki under supervision Y. Ishii (2018)). We prove that for each n = 2, 3, 4, 5, 6, \mathcal{M}_n is connected and for all n \mathcal{M}_n^0 is connected.

Kouhei Matsuura (Kyoto Univ.) Hölder continuity of Neumann heat kernels on a class of planar domains

概要 Gyrya and Saloff-Coste studied first-order Sobolev spaces on inner uniform domains with Neumann boundary condition. They proved the volume doubling property and the Poincaré inequality for the associated Dirichlet spaces. As a corollary, Neumann heat kernels on inner uniform domains are extended to continuous functions on appropriate completions of the domains and satisfy the two-sided Gaussian estimates. Moreover, the heat kernels are Hölder continuous on the complete metric spaces. However, in the result, it is difficult to calculate even the lower bounds of the indices of Hölder continuity of the heat kernels. In this talk, we give the lower bounds for Neumann heat kernels on a class of planar domains.

Toshihiro Uemura (Kansai Univ.) Global path properties of symmetric stable processes with singular/degenerate Haruna Okamura (Kansai Univ.) coefficients

概要 We consider a family of transformations and study a random dynamical system such that one transformation is randomly selected from the family and then applied on each iteration. Especially, we study random dynamical systems with indifferent fixed points and show the existence of absolutely continuous σ -finite invariant measures under some conditions. Further, we research whether the invariant measures are finite or not under some conditions.

概要 Statistical treatment for a random vector on a hyper-spheres attracts a lot attention recently, and has various applications such as seismic wave analysis, analysis for orientation of wild fire, etc. In this talk the nonlinear regression model whose predictor is a random vector on a hyper-sphere is considered. It is well known that the classical method in "linear statistic" does not work for spherical random vectors. To construct a robust estimator for the nonlinear regression function, this talk employees L1-regression method and kernel-type objective function. The proposed local-linear estimator has asymptotic normality even if the error process has infinite variance, dependent structure or heteroscedasticity. Some simulation experiments illustrate desired finite sample properties of the proposed method.

概要 This talk considers a parameter estimation problem of time-varying autoregressive models under the presence of infinite variance. Although there is rich literature on locally stationary processes, the classical papers always assume the finite variance of the model. This talk constructs a robust estimator based on the self-weighting approach proposed by Ling (2005, Journal of Royal Statistical Society B) and least absolute deviations regression. The proposed estimator is show to be asymptotically normal regardless of whether the error term has infinite variance or not. Finite sample performance of the proposed method is also investigated by simulation experiments.

概要 We propose a topological approach to statistically analyzing the Granger causality. Granger introduced his celebrated new measure of causality in the sense of prediction errors of multivariate time series 50 years ago. We localize his idea and construct a theory based on locally stationary processes for its alternative version, a natural refinement for stationary processes by Hosoya. To construct the theory, we provide a Gaussian approximation of the suprema of empirical spectral processes. Especially, the local extension of the theory serves for the statistical inference for the Granger causality curve. In addition, we provide a bootstrap procedure for the approximation to construct confidence bands. Finally, we discuss the persistence diagrams and persistence landscapes for the causality curves and numerically construct some examples of locally stationary processes for our simulations studies.

概要 Necessary and sufficient conditions for the attainments of the Borovkov-Sakhanenko and the van Trees information bounds are given when the underlying distribution is an exponential family and the conjugate prior, and the estimand is a function of the parameter. Moreover, the attainments under the Jeffreys prior are also considered.

Kiyotaka Iki (Nihon Univ.) Parsimonious bivariate t-distribution type symmetry models for square contingency tables

概要 For the analysis of square contingency tables with the same row and column ordinal classifications, this presentation proposes new models, which may be appropriate for a square ordinal table if it is reasonable to assume an underlying bivariate t-distribution having any degrees of freedom. The new models have stronger restriction than t-distribution type symmetry models (Iki et al., 2013; Iki et al., 2018). The simulation studies based on bivariate t-distribution are given.

85 統計数学

概要 We consider a balanced third-order (3^m-BTO) design T of resolution $R^*(\{10,01\})$ derived from an $SA(m;\{\lambda_{xm-x-yy}\})$ with N assemblies and $m \geq 6$. Let $\sigma^2\lambda_{\max}(T)$ be the maximum eigenvalue of the variance-covariance matrix of the estimators concerning with all the main effects based on T. If $\lambda_{\max}(T_0) \leq \lambda_{\max}(T)$ for any T, then T_0 is said to be E*-optimal, where T_0 is a 3^m-BTO design of resolution $R^*(\{10,01\})$ derived from an SA with N assemblies. In this talk, we give E*-optimal 3^m-BTO designs of resolution $R^*(\{10,01\})$ derived from SA's for $6 \leq m \leq 8$, where $N < \nu(m)$. Here $\nu(m) (= 1 + 2m + \frac{1}{6}m(m-1)(m+7))$ is the number of non-negligible factorial effects.

14:15~15:05

- - 概要 We consider the problem of estimating the mean vector of the multivariate complex normal distribution with unknown covariance matrix under an invariant loss function when n, the sample size, is smaller than p, the dimension of the mean vector. The problem of difficulty lies in the fact that the sample covariance matrix becomes singular. Following the approach of Chételet and Wells (2012, Ann. Statist. vol. 40 p. 3137-3160), we show that a modification of Baranchik-like-tpye estimators beats the MLE if it satisfies certain conditions. Based on this result, we propose the James-Stein-like shrinkage and its positive-part estimators.

概要 In this talk, we consider singular value estimations for a high-dimensional cross-covariance matrix. We first consider asymptotic properties of the conventional estimator of the singular values. We show that the estimator is affected by high-dimensional noise structures directly, so that it becomes inconsistent. In order to overcome the difficulty, we proposed a new singular value estimation method via the extended cross-data-matrix methodology. We show that the new method can enjoy consistency properties for the singular values in high-dimensional settings.

概要 In this talk, we consider testing high-dimensional eigenvectors. We produce a test statistic by using the extended cross-data-matrix (ECDM) methodology and show the unbiasedness of the ECDM test statistic even in a high-dimensional setting. We also show that the test statistic holds the asymptotic normality. We propose a new test procedure by using the asymptotic normality and evaluate its size and power asymptotically. We also give a real data analysis by using a microarray data set.

榎 本 理 恵 (成 蹊 大 理 工) 高次元成長曲線モデルにおける情報量規準の一致性

Rie Enomoto (Seikei Univ.) Consistency of some information criteria in high-dimensional growth curve models

概要 In multivariate regression model, it is known that the AIC has no consistency and the BIC has consistency under large-sample framework. However, Fujikoshi et al. (2014) and Yanagihara et al. (2015) note that the AIC has consistency and the BIC has no consistency under a high-dimensional framework. The AIC and its modifications have been proposed for selecting the degree in the growth curve model under a large-sample framework and a high-dimensional framework by Satoh et al. (1997) and Fujikoshi et al. (2013), respectively. They note that the AIC and its modifications have no consistency property.

The purpose of this paper to discuss high-dimensional asymptotic distributions of the estimators and consistency property of some information criteria under a high-dimensional framework. Our results are checked numerically by conducting a Mote Carlo simulation.

藤森 洗(早 大 理 工) 高次元・スパースな設定における確率過程の統計モデルに対する Dantzig selector

Kou Fujimori (Waseda Univ.) The Dantzig selector for statistical models of stochastic processes in high-dimensional and sparse settings

概要 The Dantzig selector, which was proposed by Candés and Tao in 2007, is an estimation procedure for regression models in high-dimensional and sparse settings. In this talk, the Dantzig selectors for some statistical models of stochastic processes are discussed. We apply this procedure to Cox's proportional hazards model and some specific models of diffusion processes and prove the consistencies and the variable selection consistencies of the estimators. Based on partial likelihood and quasi-likelihood methods which were studied intensively in low-dimensional settings, we study these statistical models of stochastic processes in high-dimensional and sparse settings, which need some mathematically challenging tasks. The consistencies of the estimators are derived from the stochastic maximal inequalities which are derived from Bernstein's inequalities for martingales and conditions, which are known to be similar to the restricted eigenvalue conditions, on Hessian matrices of log-(partial or quasi)-likelihood functions. We prove that consistencies of the estimators imply the variable selection consistencies which enable us to reduce the dimension. Using the dimension reduction, asymptotically normal estimators can be constructed.

Michitaka Furuya (Kitasato Univ.) Bounds on self domination number and an edge-deletion operation in trees

概要 Let G be a graph, and let $c \in \mathbb{R}^+ \cup \{\infty\}$. A function $f: V(G) \to \{0,1,c\}$ is called a c-self dominating function of G if for $x \in V(G)$ with f(x) < c, $\max\{f(y): y \in N_G(x)\} \ge 1$. The minimum weight $w(f) := \sum_{x \in V(G)} f(x)$ of a c-self dominating function f of G is called the c-self domination number of G. In this talk, we give a sharp upper bound of a c-self domination number for all $c \in \mathbb{R}^+ \cup \{\infty\}$. To prove our main result, we focus on an edge-deletion operation for trees, and for $\mathcal{P} \subseteq \{P_n : n \in \mathbb{N}\}$, we characterize the trees T such that one of components of T - e belongs to \mathcal{P} for every $e \in E(T)$.

Contractible edges and contractible triangles in a 3-connected graph

概要 Let G be a 3-connected graph. An edge (a triangle) of G is said to be a 3-contractible edge (a 3-contractible triangle) if the contraction of it results in a 3-connected graph. We denote $E_c(G)$ and $\mathcal{T}_c(G)$ the set of 3-contractible edges of G and the set of 3-contractible triangles of G, respectively. We prove that if $|V(G)| \geq 7$, then $|E_c(G)| + a|\mathcal{T}_c(G)| \geq \min\{\frac{1}{2} + \frac{a}{3}, \frac{6}{7}\}|V(G)|$ for every nonnegative real number a. As a corollary of this, if $|V(G)| \geq 7$, then $|E_c(G)| + \frac{15}{14}|\mathcal{T}_c(G)| \geq \frac{6}{7}|V(G)|$; and if G has no contractible triangles, then $|E_c(G)| \geq \frac{6}{7}|V(G)|$. We also determine the extremal graphs of these results.

Long-time behavior of the Grover walk on the two-dimensional lattice

(Yokohama Nat. Univ.)

概要 The Grover walk has been investigated for many applications, such as quantum searching algorithms. Inui et al. (2005) got both limit measure and weak limit theorem as a long-time behavior of the 3-state Grover walk on the one-dimensional lattice. However, the 4-state Grover walk on the two-dimensional lattice was studied only for time-averaged limit measure at the starting point and weak limit theorem. We obtained the time-averaged limit measure on coordinate axes and analyzed the asymptotic behavior for the Grover walk in two dimensions.

91 応用数学

概要 These days, we use online sites to see news, SNS, and so on. There are various services using recommendation models. Recently, the quality of recommendation models influences on the earnings of merchandises very much. In this situation, we propose new models based on user's selection process as walks. Moreover, we analyze user's preference using random, correlated, and quantum walks, respectively.

概要 In this work, we propose a new invariant for 2D persistence modules called the compressed multiplicity and show that it generalizes the notions of the dimension vector and the rank invariant. In addition, we propose an "interval-decomposable approximation" $\delta^*(M)$ of a 2D persistence module M. In the case that M is interval-decomposable, we show that $\delta^*(M) = M$. Furthermore, even for representations M not necessarily interval-decomposable, $\delta^*(M)$ preserves the dimension vector and the rank invariant of M.

93 応用数学

概要 There is an isometry theorem relating the interleaving distance between 1D persistence modules and the bottleneck distance of their corresponding barcodes. The bottleneck distance is defined by matchings between the barcodes, and can be seen as a "diagonal" interleaving of the persistence modules. We wish to study how far arbitrary interleavings are from diagonal interleavings. To that end, we work in a more general setting of prosets. We introduce the concept of a shoelace of a proset and show that the representation category of the shoelace is isomorphic to the category of interleavings. Through this, we can formulate interleavings between interleavings in this new setting. Finally, we show that any two Λ-interleavings are $\tilde{\Lambda}$ -interleaved, where $\tilde{\Lambda}$ is a "twisted" interleaving on the shoelace naturally induced from Λ .

 Field choice problem on persistent homology

概要 In this presentation, I will talk about the problem of the choice of a coefficient field on persistent homology. When we compute a persistence diagram, we need to select a coefficient field before computation. We should understand the dependency of the diagram on the coefficient field for the better computation and interpretation of the diagram. We give some sufficient and necessary conditions for the independence of the diagram to the coefficient field. We also give an efficient algorithm to determine whether a given input satisfies the condition or not. The algorithm is already implemented in HomCloud, our data analysis software based on persistent homology. The software will be helpful for data analysis using persistent homology. This is the joint work with Michio Yoshiwaki (RIKEN).

概要 The time evolution version of the percolation model is called the first passage percolation model: each edge of the cubical lattice is assigned a random time, and consider the growth of the percolation region B(t), which consists of the vertices that can be arrived from the origin within time t > 0. One of the most basic theorem is called shape theorem, saying that the normalized region B(t)/t converges to some limit shape. In this study, a generalized FPP model, defined on a crystal lattice, is considered. In this setting, the generalized version of the shape theorem is obtained and the limit shape depends only on the graph structure and the period of the lattice.

24 清 水 超 貴 (京 大 理) マルチパラメータパーシステントホモロジーの分解論における極限定理 平 岡 裕章(京大高等研) Tatsuki Shimizu (Kyoto Univ.) Limit theorems in the decomposition theory of multi-parameter persis-Yasuaki Hiraoka (Kyoto Univ.) tent homology 概要 Unlike the 1D case, there exists an algebraic difficulty in the decomposition theory of multi-parameter persistence modules. We try to solve this difficulty not purely algebraically, but stochastically by considering the appropriate scaling limit. We first show the existence of the scaling limit of some invariants: multiplicity of the interval representation and rank invariant. E. G. Escolar 25 Mapping firms' locations in technological space: A topological analysis of patent statistics · · · · · · · · 15 (理化学研 AIP・京大高等研) 平 岡 裕 章 (京大高等研) 伊神 満(Yale Univ.) (MIT Sloan) Y. Ozcan Emerson Gaw Escolar Mapping firms' locations in technological space: A topological analysis (RIKEN/Kyoto Univ.) of patent statistics Yasuaki Hiraoka (Kyoto Univ.) (Yale Univ.) Mitsuru Igami Yasin Ozcan (MIT Sloan) 概要 Where do firms innovate? Locating and visualizing them in technological space is challenging, because it is high-dimensional and unstructured. We address this issue by using a method in topological data analysis called Mapper, which combines local clustering with global reconstruction. We apply this method to a panel of 333 major firms' patent portfolios in 1976–2005 in 430 technological areas and propose a definition of the characteristic "flares" that appear in the Mapper graph. Results suggest the Mapper graph captures salient patterns in firms' patenting histories, and the type and length of flares are correlated with firms' financial performances in a statistically and economically significant manner. 力学系モデルおよび統計的因果探索に基づく遺伝子制御ネットワークの 井 元 佑 介 (京 大 ASHBi) 平岡裕章 (京大高等研·京大ASHBi·理化学研AIP) 清水昌平 (滋賀大DS・理化学研 AIP) 前田高志ニコラス (理化学研 AIP) 小 島 洋 児 (京大iPS細胞研) 斎藤通紀 (京大ASHBi·京大医·京大iPS細胞研) (Kyoto Univ.) Mitinori Saitou (Kyoto Univ./Kyoto Univ./Kyoto Univ.)

概要 The gene regulatory network (GRN) is a directed graph model with annotated edges that shows the regulatory relationship of gene expressions. In this study, we develop a method that estimates GRN from gene expression data by utilizing a causal discovery method 'LiNGAM' and a dynamical system 'switching model'. We derive a linear model that is applicable in LiNGAM by discretizing the switching model and applying the multi-regression to it. As a result, GRN is constructed by superposing the adjacency matrices estimated by LiNGAM.

Takeshi Gotoda (Nagoya Univ.) Numerical study of initial configurations leading to collapse in the point-vortex system

概要 Self-similar collapse is a notable phenomena in the point vortex system. The structure of initial configurations leading to self-similar collapses has been made clear for the 3-point vortex problem and some examples of self-similar collapsing solutions for the 4 and 5-point vortex problem have been obtained. In this study, we investigate initial configurations leading to self-similar collapse for the N-point vortex problem by using numerical simulations and compare some properties of them by changing the number of N. We also show the existence of relative equilibria forming symmetrical configurations.

<u>Taito Tauchi</u> (Univ. of Tokyo) Existence of a conjugate point in the incompressible Euler flow on an Tsuyoshi Yoneda (Univ. of Tokyo) ellipsoid

概要 Existence of a conjugate point in the incompressible Euler flow on a sphere and an ellipsoid is considered. Misiołek (1996) formulated a differential-geometric criterion (we call M-criterion) for the existence of a conjugate point in a fluid flow. In this talk, it is shown that no zonal flow (stationary Euler flow) satisfies M-criterion if the background manifold is a sphere, on the other hand, there are zonal flows satisfy M-criterion if the background manifold is an ellipsoid (even it is sufficiently close to the sphere). The conjugate point is created by the fully nonlinear effect of the inviscid fluid flow with differential geometric mechanism.

Pinned pulse solutions inside a bump type heterogeneity

概要 We analyse pinned front and pulse solutions in a singularly perturbed three-component FitzHugh—Nagumo model with a bump type heterogeneity. We derive explicit conditions for the existence and stability of pinned solutions by combining geometric singular perturbation techniques and an action functional approach. We show that the model in the 1 activator - 2 inhibitors framework only supports symmetric pinned pulse solutions that are pinned in the middle of the bump region.

李 聖 林 (広 島 大 理) 反応拡散方程式、生命のパターン形成におけるその無限の才能

Sungrim Seirin Lee (Hiroshima Univ.) Reaction-diffusion equation, its infinite talent in pattern formation of life science

概要 Since A. Turing's landmark paper (1952), reaction-diffusion equations became a symbol of mathematical model for pattern formation in life science. A short-range self-activation and long-range inhibition have been considered as a fundamental mechanism by which a symmetry breaking is triggered and a pattern, namely, non-constant steady state, is formed in reaction-diffusion systems. And many mathematical models in pattern formation also have based on it. However, once we take a step back and look at the truly pure essence of reaction-diffusion equation(s), we can find more potential of reaction-diffusion equation(s) and see various patterning dynamics in a simple reaction-diffusion equation(s) without a basis of activation-inhibition chemical reactions. In this talk, I will introduce such an infinite potential of reaction-diffusion equation(s) as pattern forming system which has been done by myself during theses 10 years. I also would like to discuss how mathematical modeling (or mathematical modeler) in life science and pure mathematics (or pure mathematician) can be collaborated and open a new trail of applied mathematics.

概要 We give the binomial expansion of Newton method from the first term to m (natural number of more than 2) term, and show that the convergences become the quadratic and linearly (Theorem 1.7). Next in case of the quadratic convergence, we give the convergence comparison of the binomial expansion of Newton method from the first term to m term and Newton method (Theorem 1.8 (1.13), (1.14)). Next we give the convergence comparison of the binomial expansion of the Newton method from the first term to the second term and from the first term to more than three term (Theorem 1.8 (1.15)). And we give convergence comparisons of the binomial expansion of Newton method from the first term to m term and Newton method using the curvatures, and concaves and convexes of curves (Theorem 2.3–2.9).

尾 崎 克 久 行列積に対するエラーフリー変換:基礎・応用・未来 (芝浦エ大システム理工)

Katsuhisa Ozaki Error-free transformation for matrix multiplication: Basic, applications, and future

概要 This talk concerns the numerical computations of matrix multiplication. Floating-point numbers and floating-point arithmetic defined in IEEE 754 are widely used in numerical computations. The performance of the numerical computation is very high. On the other hand, the problem of rounding errors is crucial. We proposed an error-free transformation of matrix multiplication. The matrix product is transformed into an unevaluated sum of floating-point matrices. This technique is useful for accurate numerical computations. Besides, the error-free transformation is applied to interval matrix multiplication and generation of test matrices in numerical linear algebra. Moreover, we can develop reproducible numerical algorithms and a fast algorithm for matrix multiplication using low precision arithmetic on GPGPU based on the error-free transformation.

Naoki Fujita (Univ. of Tokyo) Toric degenerations arising from Newton-Okounkov bodies and cluster structures

概要 The theory of toric varieties gives an elegant dictionary translating geometric and topological properties into combinatorial properties in terms of cones and polytopes. In order to apply this powerful dictionary to other projective varieties, we can use degenerations to toric varieties, called toric degenerations. In this talk, we study the following two systematic methods of constructing toric degenerations: Newton-Okounkov bodies and cluster algebras. In the first part of this talk, we survey the theory of Newton-Okounkov bodies and its applications in geometry, including Harada-Kaveh's construction of completely integrable systems. In the second part, we study Newton-Okounkov bodies from the theory of cluster algebras. We can realize Gross-Hacking-Keel-Kontsevich's toric degenerations of compactified cluster varieties as ones coming from Newton-Okounkov bodies. Throughout this talk, we especially focus on the case of flag varieties whose toric degenerations are closely related to representation theory.

Takuya Ukida (Tokyo Tech) Genus zero PALF structures on the Akbulut-Yasui plugs

概要 We construct a genus zero PALF structure on each of plugs introduced by Akbulut and Yasui and describe the monodromy as a positive factorization in the mapping class group of a fiber. We also examine the monodromies of PALFs on a certain pair of compact Stein surfaces such that one is obtained by applying a plug twist to the other.

14 浅野喜敬(東北大理) Vertical 3-manifolds in simplified genus 2 trisections of 4-manifolds · · · 15
Nobutaka Asano (Tohoku Univ.) Vertical 3-manifolds in simplified genus 2 trisections of 4-manifolds

概要 A trisection is a decomposition of a closed 4-manifold by 3 tuple of 4-dimensional 1-handlebodies, which was introduced by Gay and Kirby. They proved the existence of a trisection for any closed 4-manifold by using a stable map (called a trisection map) from the 4-manifold to \mathbb{R}^2 . After their work, a simplified trisection was introduced by Baykur and Saeki. They proved the existence of a simplified trisection from a simplified broken Lefschetz fibration. In this talk, we will give a classification of 3-manifolds that can be obtained as the preimages of arcs on \mathbb{R}^2 by simplified genus 2 trisection maps, which we call vertical 3-manifolds.

15 谷 口 正 樹 (東 大 数 理) 2次元結び目の Seifert 超曲面と Chern-Simons 汎関数について 15 Masaki Taniguchi (Univ. of Tokyo) Seifert hypersurfaces of 2-knots and Chern-Simons functional

概要 In this talk, we treat oriented 2-knots: smooth embeddings from S^2 to S^4 equipped with orientations. For a given oriented 2-knot, we introduce a functional from the SU(2)-representation space of its knot group to (0,1]. The image of the functional gives an isotopy invariant of an oriented 2-knot. We show several properties of the functional, including a connected sum formula, a relation between the functional and SU(2)-representation, and an orientation reversing formula. Moreover, we calculate the images of the functionals for ribbon 2-knots and twisted spun knots of torus knots, rational knots, and Montesinos knots. Using a refinement of instanton Floer theory and several properties of the functional, we relate the existence of a certain class of Seifert hypersurface with the existence of an irreducible SU(2)-representation of its knot group.

概要 We define the regularzied self-inductances of a knot from Neumann formula and Weber formula of the mutual inductance of a pair of closed circuits. We show that they are different by twice the length. We also study the residues and related quantities.

今野北斗(理化学研) Gauge theory and diffeomorphism and homeomorphism groups
Hokuto Konno (RIKEN) Gauge theory and diffeomorphism and homeomorphism groups

概要 I will survey recent development of applications of gauge theory to the diffeomorphism and homeomorphism groups of 4-manifolds.

It is known that, for an arbitrary closed manifold of dimension less than 4, the inclusion map from the diffeomorphism group to the homeomorphism group is a weak homotopy equivalence. Therefore it is interesting to ask if there is a homotopical difference between the diffeomorphism and homeomorphism groups in other dimensions. Thanks to one of Donaldson's results, it turned out that 4 is the first dimension in which such a difference appears. But until recently, no one had have any systematic way to extract such differences in dimension 4. This talk is aimed at explaining that gauge theory for families gives a systematic way as follows.

After Donaldson's celebrated diagonalization theorem, gauge theory has given strong constraints on the topology of smooth 4-manifolds, such as Furuta's 10/8-inequality. Combining such constraints with Freedman's theory, one may find many non-smoothable topological 4-manifolds. Recently, a family version of this argument was started by T. Kato, N. Nakamura and myself, and soon later it was developed also by D. Baraglia and his collaborating work with myself. More precisely, considering gauge theory for smooth fiber bundles of 4-manifolds, they obtained some constraints on the topology of smooth fiber bundles of 4-manifolds. Moreover, it turned out that one may detect non-smoothable topological fiber bundles of smooth 4-manifolds using such constraints. The existence of such bundles implies that there are homotopical differences between the diffeomorphism and homeomorphism groups of the 4-manifolds given as the fibers of the non-smoothable bundles.

Mattman (California State Univ., Chico) 概要 We show that two-bridge knots and alternating fibered knots admit no purely cosmetic surgeries, i.e., no pair of distinct Dehn surgeries on such a knot produce 3-manifolds that are homeomorphic as oriented manifolds. Our argument, based on a recent result by Hanselman, uses several invariants of knots

or 3-manifolds; for knots, we study the signature and some finite type invariants, and for 3-manifolds, we deploy the $SL(2,\mathbb{C})$ Casson invariant.

種数1ファイバー結び目に沿ったデーン手術と基本群の左順序付け可能 中 江 康 晴 (秋田大理工) 市原一裕(日大文理) 性について 15 Yasuharu Nakae (Akita Univ.) Dehn surgeries along genus one fibered knots and left-orderability of Kazuhiro Ichihara (Nihon Univ.) fundamental groups

概要 We study Dehn surgeries along genus one fibered knots and which resultant manifolds have leftorderable fundamental groups. The 3-sphere has only two genus one fibered knots, the trefoil and the figure-eight knot. In contrast with the 3-sphere, some lens spaces have more genus one fibered knots. In 2014, Baker completely classified the number of genus one fibered knots in lens spaces. Along the classification, we show that, on some class of such knots in lens spaces, all integral surgeries yield 3manifolds with left-orderable fundamental groups. In order to prove this theorem, we examine the existence of Anosov flow whose stable/unstable foliation is R-covered in the resultant manifold.

概要 We show that if a link L has a closed n-braid representative admitting a non-degenerate exchange move, an exchange move that does not obviously preserve the conjugacy class, L has infinitely many non-conjugate closed n-braid representatives.

概要 Based on the non-stationary and the stationary Ruijsenaars functions, we present a conjecture concerning the eigenvalue problem associated with the Ruijsenaars operator.

概要 In this talk, we realize the affine analogue of the Macdonald functions, which are referred to as the non-stationary Ruijsenaars functions, by the Ding-Iohara-Miki algebra. Moreover, we present various combinatorial expressions of the non-stationary Ruijsenaars functions by using a duality formula for the intertwining operators of the Ding-Iohara-Miki algebra.

16:30~17:30 特別講演

渡邉英也(京大数理研) iquantizations

Hideya Watanabe (Kyoto Univ.) quantizations

概要 iquantum groups are generalizations of quantum groups appearing as one-sided coideal subalgebras of quantum groups in the theory of quantum symmetric pairs. Recently, numerous results which we should call "iquantizations" have been reported. iquantizations have two meanings; (1) generalizing what is known for usual quantum groups to iquantum groups, (2) quantizing what is known for classical Lie algebras but cannot be quantized by usual quantum groups, by means of iquantum groups. In this talk, I introduce examples of iquantizations such as canonical basis, geometric construction, Hall algebraic construction, GT-basis of type B/D, Schur duality of type B/C/D, highest weight theory, and crystal basis.

$9:45\sim11:30$

概要 Quantum curves are helpful for studying the Painlevé equations or many other mathematical physics equations such as the correspondence between spectral theories and topological strings. We provide explicit expressions for the quantum curves of genus one and the actions of Weyl group. We further comment on the applications of these curves to the analysis of mirror maps.

概要 Okounkov and Pandharipande constructed what they call "dressing operators" in their study on the integrable structure of the Gromov-Witten theory of CP^1 . These operators are used to convert a generating function of the equivariant Gromov-Witten invariants to a tau function of the equivariant Toda hierarchy. We redefine these operators in the perspective of the Lax formalism of the 2D Toda hierarchy. This leads to yet another proof of the fact that the generating function of the equivariant Gromov-Witten invariants yields a special solution of the equivariant Toda hierarchy.

概要 We study a certain q-quadratic Garnier system. Choosing a suitable Padé problem on q-quadratic grid, we simultaneously construct the evolution equation, the Lax pair and determinant formulae of special solutions in terms of the very-well-poised balanced q-hypergeometric function. We discuss some specializations of the system.

16:15~17:15 特別講演

斉藤義久(立教大理) 楕円 Artin 群について

Yoshihisa Saito (Rikkyo Univ.) On elliptic Artin groups

概要 In the study of representation theory of Lie groups and Lie algebras, the regular Weyl group orbit spaces and their fundamental groups (called Artin groups or generalized braid groups) have quite important roles.

In the middle of 80's, motivated by the study of singularity theory, Kyoji Saito introduced the notion of elliptic root systems, and study their basic properties. Especially, he introduced an "elliptic analogue" of the regular Weyl group orbit spaces, so-called the elliptic regular orbit spaces, and study their detailed structure in algebraic and differential geometrical point of view.

In this talk, we study the fundamental groups of the regular elliptic Weyl group orbit spaces. These groups are presented by a generator system associated with the elliptic diagrams, and we call them the elliptic Artin groups. Furthermore, some basic properties of these groups will be also discussed. Especially, the elliptic regular orbit space is defined over the moduli space of elliptic curves. This fact leads us to the description of the elliptic modular group actions on elliptic Artin groups. This talk is based on a joint work with Kyoji Saito.
